

P524: Survey of Instrumentation and Laboratory Techniques

Week 2 (1b):Python
programming

Digital Computer

- Digital electronics devices store and process bits electronically.
 - A **bit** represents data using 1s and 0s
 - Eight bits is a **byte** – the standard grouping in digital electronics
 - 64-bit machines (your laptop computer), corresponding to eight-byte words.

Number Representation

Decimal representation:

Decimal	4-Bit Binary	Hexadecimal
0	0000	0
1	0001	1
2	0010	2
3	0011	3
4	0100	4
5	0101	5
6	0110	6
7	0111	7
8	1000	8
9	1001	9
10	1010	A
11	1011	B
12	1100	C
13	1101	D
14	1110	E
15	1111	F

Place:

4th

3rd

2nd

1st

Place value:

10^3

10^2

10^1

10^0

Data:

0

0

1

3

Value:

$0 \times 1000 + 0 \times 100 + 1 \times 10 + 3 \times 1 = 13$

Number Representation

Binary representation:

Decimal	4-Bit Binary	Hexadecimal
0	0000	0
1	0001	1
2	0010	2
3	0011	3
4	0100	4
5	0101	5
6	0110	6
7	0111	7
8	1000	8
9	1001	9
10	1010	A
11	1011	B
12	1100	C
13	1101	D
14	1110	E
15	1111	F

Place:

4th

3rd

2nd

1st

Place value:

2^3

2^2

2^1

2^0

Data:

1

1

0

1

Value:

$1 \times 8 + 1 \times 4 + 0 \times 2 + 1 \times 1 = 13$

Bit, bytes, and words

- Digital electronics devices store and process bits electronically.
 - A bit represents data using 1s and 0s
 - Eight bits is a byte – the standard grouping in digital electronics
 - Hexadecimal representation of a number by preceding the hex digits with 0x

e.g. Show that the number 63 can be represented as follows:

$0x3F = 0b00111111 = 0d63$

- bytes are grouped together to form words. The number of bytes per word depends on the architecture of a particular memory or processor chip; common values are two, four, and eight bytes per word.
 - Most of your laptops are 64-bit machines, corresponding to eight-byte words.

ASCII table

ASCII stands for American Standard Code for Information Interchange.

On the right is the ASCII character table, including descriptions of the first 32 characters.

ASCII was originally designed for use with teletypes, and so the descriptions are somewhat obscure and their use is frequently not as intended.

Java actually uses Unicode, which includes ASCII and other characters from languages around the world.

Dec	Char	Dec	Char	Dec	Char	Dec	Char
0	NUL (null)	32	SPACE	64	@	96	`
1	SOH (start of heading)	33	!	65	A	97	a
2	STX (start of text)	34	"	66	B	98	b
3	ETX (end of text)	35	#	67	C	99	c
4	EOT (end of transmission)	36	\$	68	D	100	d
5	ENQ (enquiry)	37	%	69	E	101	e
6	ACK (acknowledge)	38	&	70	F	102	f
7	BEL (bell)	39	'	71	G	103	g
8	BS (backspace)	40	(	72	H	104	h
9	TAB (horizontal tab)	41	)	73	I	105	i
10	LF (NL line feed, new line)	42	*	74	J	106	j
11	VT (vertical tab)	43	+	75	K	107	k
12	FF (NP form feed, new page)	44	,	76	L	108	l
13	CR (carriage return)	45	-	77	M	109	m
14	SO (shift out)	46	.	78	N	110	n
15	SI (shift in)	47	/	79	O	111	o
16	DLE (data link escape)	48	0	80	P	112	p
17	DC1 (device control 1)	49	1	81	Q	113	q
18	DC2 (device control 2)	50	2	82	R	114	r
19	DC3 (device control 3)	51	3	83	S	115	s
20	DC4 (device control 4)	52	4	84	T	116	t
21	NAK (negative acknowledge)	53	5	85	U	117	u
22	SYN (synchronous idle)	54	6	86	V	118	v
23	ETB (end of trans. block)	55	7	87	W	119	w
24	CAN (cancel)	56	8	88	X	120	x
25	EM (end of medium)	57	9	89	Y	121	y
26	SUB (substitute)	58	:	90	Z	122	z
27	ESC (escape)	59	;	91	[	123	{
28	FS (file separator)	60	<	92	\	124	
29	GS (group separator)	61	=	93	]	125	}
30	RS (record separator)	62	>	94	^	126	~
31	US (unit separator)	63	?	95	_	127	DEL

A floating point number (64-bit, or 8 byte)

what	which bit(s)	range of values
sign	63 (1 bit)	[0, 1]
exponent	52 – 62 (11 bits)	[-1022, 1023]
significand	0 – 51 (52 bits)	$[0, 4.5035996 \times 10^{15}]$

A simple model of a computer

- The model of a computer includes a simple CPU, including its communication lines and one register, a part of the CPU that communicates with the outside world.
- Each time the system clock “ticks,” the Logic unit fetches, then executes an instruction from the memory address specified in the Program counter.
- Instructions for our toy computer might contain three fields: *an operation code* (op code) and *a pair of addresses $a1$ and $a2$* . To add the contents of $a1$ to the contents of $a2$, storing the result in $a2$, we’d have the operating system load an instruction into memory with the appropriate op code and address values.

In-class assignment and Homework (due 9/10)

- Download and install Anaconda Scientific Python (<https://www.anaconda.com/download>)
- Write a Python script that calculates an approximation to π using the arctan series (see 1b write-up, p.22), and compare its accuracy after the $n = 10$ term, 100 term, 10,000 term, and 1,000,000 term. (Use a conditional statement to print something after the appropriate terms.)
- (email finished programs to jcl11@illinois.edu)
