## Useful Formulae

## Physical constants

Avagadro's number Boltzmann constant

$$
\begin{array}{ll}
N_{A} & 6.022 \times 10^{23} / \mathrm{mol} \\
k_{B} & 1.38 \times 10^{-23} \mathrm{~J} / \mathrm{K} \\
& 8.617 \times 10^{-5} \mathrm{eV} / \mathrm{K} \\
R & 8.314 \mathrm{~J} / \mathrm{mol} \mathrm{~K} \\
& 8.206 \times 10^{-2} \mathrm{l} \mathrm{~atm} / \mathrm{mol} \mathrm{~K} \\
& k_{B} N_{A}
\end{array}
$$

Ideal gas constant

Gravity at sea level
g $\quad 9.8 \mathrm{~m} / \mathrm{s}^{2}$
One atmosphere speed of light Planck constant
electron volt electron charge electron mass electron mag moment proton mass proton mag moment neutron mass
$1.013 \times 10^{5} \mathrm{~Pa}\left(\mathrm{~J} / \mathrm{m}^{3}\right)$
c $\quad 2.998 \times 10^{8} \mathrm{~m} / \mathrm{s}$
$h \quad 6.626 \times 10^{-34} \mathrm{~J} \mathrm{~s}$
$4.135 \times 10^{-15} \mathrm{eV} \mathrm{s}$
$\hbar \quad 1.054 \times 10^{-34} \mathrm{~J} \mathrm{~s}$
$0.658 \times 10^{-15} \mathrm{eV} \mathrm{s}$
$\mathrm{eV} \quad 1.602 \times 10^{-19} \mathrm{~J}$
e $\quad 1.602 \times 10^{-19} \mathrm{C}$
$m_{e} \quad 9.109 \times 10^{-31} \mathrm{~kg}$
$\mu_{e} \quad 9.2848 \times 10^{-24} \mathrm{~J} / T$
$m_{p} \quad 1.673 \times 10^{-27} \mathrm{~kg}$
$\mu_{p} \quad 1.4106 \times 10^{-26} \mathrm{~J} / \mathrm{T}$
$m_{n} \quad 1.675 \times 10^{-27} \mathrm{~kg}$
939.6 MeV/c ${ }^{2}$

Molecular masses

| Particle | $\mathrm{g} / \mathrm{mol}$ |
| :--- | :---: |
| $\mathrm{N}_{2}$ | 28 |
| $\mathrm{O}_{2}$ | 32 |
| He | 4 |
| Ar | 40 |
| $\mathrm{CO}_{2}$ | 44 |
| $\mathrm{H}_{2}$ | 2 |
| Si | 28 |
| Ge | 73 |
| Cu | 64 |
| Al | 27 |

| Symbol | meaning |
| :--- | :--- |
| $T$ | Temperature |
| $U$ | Internal energy |
| $S$ | Entropy |
| $\Omega$ | Number of equally probable states |
| $C_{V}$ | Heat capacity at constant volume |
| $C_{p}$ | Heat capacity at constant pressure |
| $V$ | Volume |
| $p$ | Pressure |
| $\mu$ | Chemical potential |
| $N$ | Number of particles |
| $n$ | Number of moles of particles $\left(n=N / N_{A}\right)$ |
| $d W_{o n}$ | Work on $-p d V$ |
| $d W_{b y}$ | Work by $p d V$ |
| $H$ | Enthalpy $U+p V$ |

## Mathematical identities and combinatorics

$N$ distinguishable particles with $M$ possible states each
$N$ indistinguishable particles with $M$ possible states each
Choose $q$ from $N$ options without replacement

$$
\begin{gathered}
M^{N} \\
M^{N} / N! \\
\binom{N}{q}=\frac{N!}{q!(N-q)!}
\end{gathered}
$$

$$
\begin{array}{r}
\ln (A)-\ln (B)=\ln (A / B) \\
e^{A+B}=e^{A} e^{B}
\end{array}
$$

## Derivatives and differentials

Thermodynamic derivative notation.

$$
\left(\frac{d S}{d U}\right)_{V, N} \equiv \frac{\partial S(U, V, N)}{\partial U}
$$

Integration to find changes

$$
\Delta x=\int d x
$$

Chain rule

$$
\frac{d z}{d x}=\frac{d z}{d y} \frac{d y}{d x}
$$

## Entropy

$$
S=k_{B} \ln \Omega
$$

Definition of temperature, pressure, and chemical potential

$$
\begin{aligned}
\frac{1}{T} & \equiv\left(\frac{d S}{d U}\right)_{V, N} \\
\frac{p}{T} & \equiv\left(\frac{d S}{d V}\right)_{U, N} \\
\frac{\mu}{T} & \equiv-\left(\frac{d S}{d N}\right)_{U, V}
\end{aligned}
$$

## Heat capacity

Always true

$$
C \equiv \frac{d Q}{d T}
$$

$C_{V}=\frac{d U}{d T}$
Constant volume

$$
C_{p}=\frac{d U}{d T}+p \frac{d V}{d T}
$$

## Heat conduction

$$
q=-k \frac{T_{2}-T_{1}}{d}
$$

Combine heat conductivity $k$ same as electrical conductivity.

## Ideal gas

Equation of state

$$
p V=N k T
$$

Isothermal processes

$$
p=\frac{N k T}{V}
$$

Adiabatic processes

$$
p=\frac{C}{V^{\gamma}}
$$

$C$ constant, $\gamma=\frac{2}{N_{D O F}}+1$
Kinetic ideal gas assumption:

$$
\frac{1}{2} m\left\langle v^{2}\right\rangle=\frac{3}{2} k T
$$

## Equipartition

$$
U=\frac{N_{D O F}}{2} N k T+\text { constant }
$$

Translational and rotational motion counts as 1 degree of freedom each, vibrational counts as 2 degrees of freedom each.

Thermodynamic processes
First law of thermodynamics (division into work and heat)

$$
d U=d Q-p d V
$$

Second law of thermodynamics

$$
\int_{S_{i}}^{S_{f}} d S \geq 0
$$

Fundamental relation of thermodynamics

$$
d S=\frac{1}{T} d U+\frac{p}{T} d V-\frac{\mu}{T} d N
$$

At constant number,

$$
d S=\frac{d Q}{T}=\frac{C}{T} d T
$$

Typical processes:
Isothermal $T$ constant reversible
Isobaric $p$ constant irreversible
Isochoric $V$ constant irreversible
Adiabatic $\quad Q=0 \quad$ reversible
Maximum Carnot efficiency between two reservoirs at $T_{H}, T_{C}$

$$
\frac{W}{Q_{H}} \leq 1-\frac{T_{C}}{T_{H}}
$$

Coefficient of performance

- Refrigeration: $Q_{C} / W$
- Heat pump: $Q_{H} / W$

Boltzmann factors and quantum systems Boltzmann factor for state $i$

$$
f_{i}=e^{-E_{i} / k T}
$$

Probability of state $i$

$$
P(i)=\frac{f_{i}}{\sum_{j} f_{j}}
$$

Average internal energy

$$
U=\sum_{i} P_{i} E_{i}
$$

Heat capacity of a collection of harmonic oscillators with energy separation $h f$

$$
C_{V}=3 N k \frac{x^{2} e^{x}}{\left(e^{x}-1\right)^{2}}, x=\frac{h f}{k T}
$$

Number of ways to distribute $q$ quanta in $N$ oscillators

$$
\Omega=\binom{N+q-1}{q}
$$

Helmholtz free energy ( $\mathrm{T}, \mathrm{V}, \mathrm{N}$ )

$$
F=U-T_{e n v} S
$$

- Equilibrium occurs at minimum $F$
- $W_{\max }=-\Delta F$

Chemical potential

$$
\mu=\left(\frac{d F}{d N}\right)_{T, V}
$$

Solutions

$$
\frac{N_{\text {solute }}}{N_{\text {solvent }}}=C e^{-\Delta / k T}
$$

Semiconductors

$$
\frac{N_{\text {conductors }}}{N_{\text {atoms }}}=C e^{-\Delta / 2 k T}
$$

Conductivity is proportional to the number of conductors.
Gibbs free energy ( $\mathrm{T}, \mathrm{p}, \mathrm{N}$ )

$$
G=U-T S+p V=\mu(p, T) N
$$

- Equilibrium occurs at minimum $G$
- $W_{\max }=-\Delta G$

## Phases and phase transitions

Only exist at fixed pressure and temperature (otherwise coexistence of phases). Lowest $\mu \rightarrow$ equilibrium phase.
Latent heat:

$$
L=\Delta H=T \Delta S
$$

Variation of the chemical potential of phase $X$ as a function of pressure and temperature:

$$
d \mu_{X}=\frac{V_{X}}{N_{X}} d p-\frac{S_{X}}{N_{X}} d T
$$

- Number Density: $N_{X} / V_{X}$
- Entropy per particle: $S_{X} / N_{X}$
