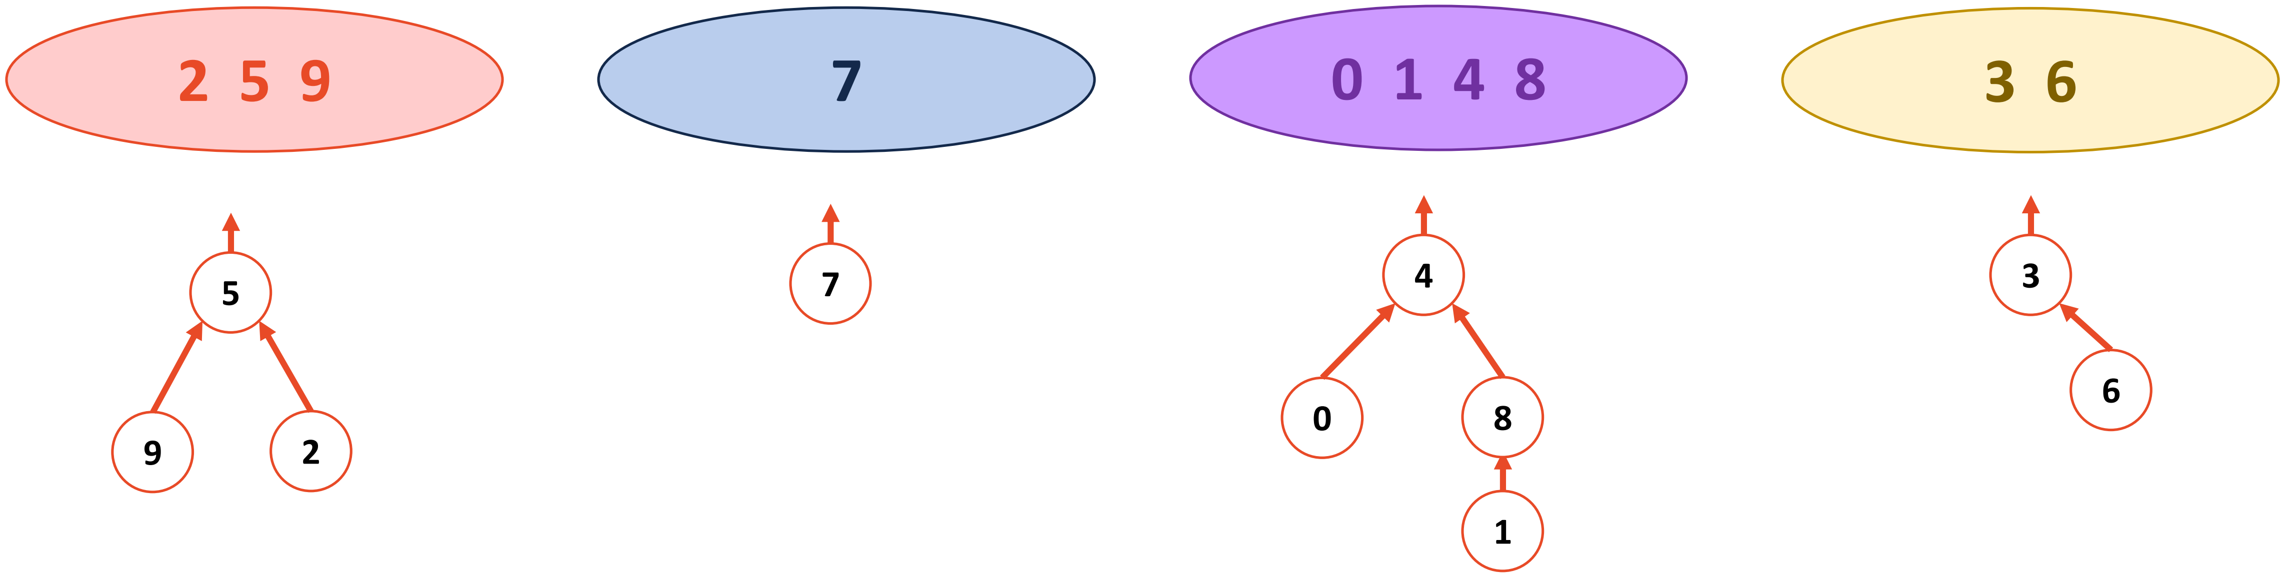
Data Structures

November 9 – Disjoint Sets Finale + Graphs

Wade Fagen-Ulmschneider

Disjoint Sets



0	1	2	3	4	5	6	7	8	9
4	8	5	6	-1	-1	-1	-1	4	5

Disjoint Sets Find

```
int DisjointSets::find() {
  if ( s[i] < 0 ) { return i; }
  else { return _find( s[i] ); }
}
```

Running time?

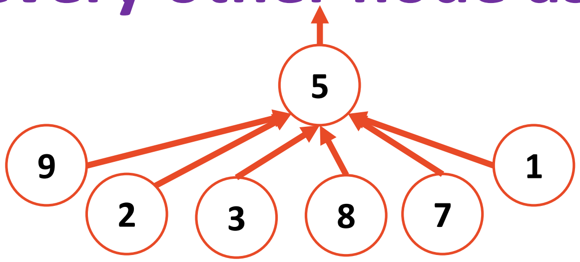
Structure: A structure similar to a linked list

Running time: O(h) < O(n)

What is the ideal UpTree?

Structure: One root node with every other node as it's child

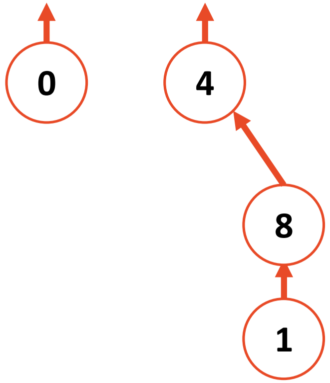
Running Time: O(1)



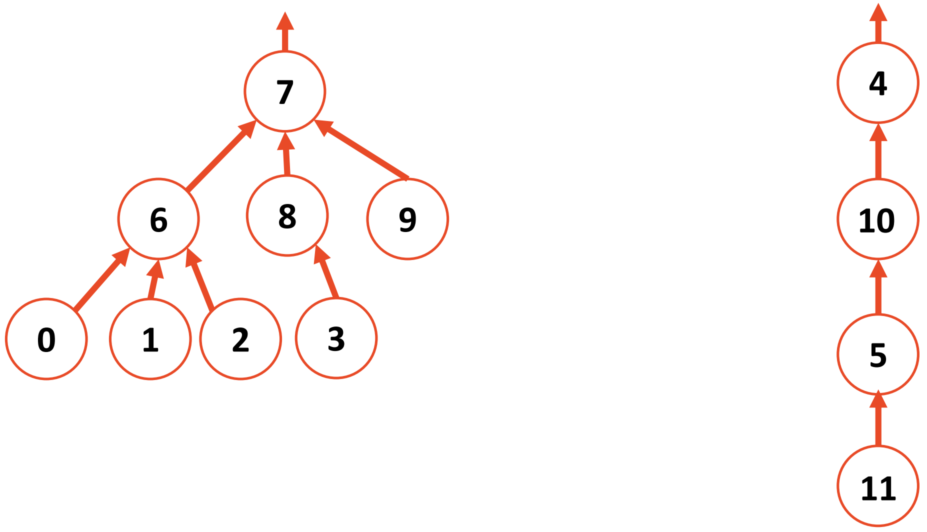
Disjoint Sets Union

```
void DisjointSets::union(int r1, int r2) {

}
```



Disjoint Sets – Smart Union



Union by height
root := -h -1

0	1	2	3	4	5	6	7	8	9	10	11
6	6	6	8	-4	10	7	-3	7	7	4	5

***Idea**: Keep the height of the tree as small as possible.*

Union by size
root := -n

0	1	2	3	4	5	6	7	8	9	10	11
6	6	6	8	-4	10	7	-8	7	7	4	5

***Idea**: Minimize the number of nodes that increase in height*

Both guarantee the height of the tree is: O(lg(n))

Disjoint Sets Find

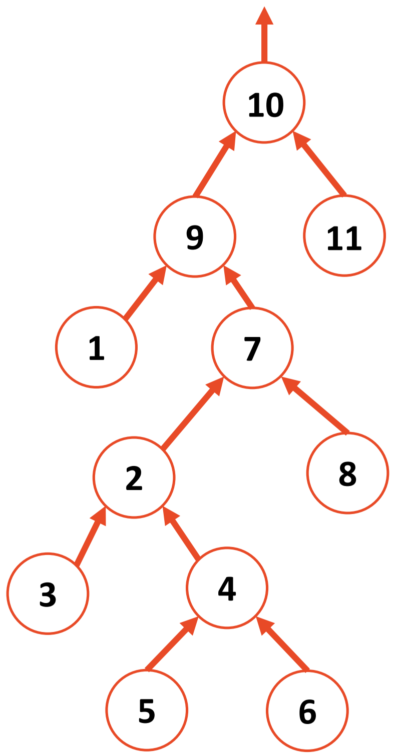
```
int DisjointSets::find(int i) {
  if ( arr_[i] < 0 ) { return i; }
  else { return _find( arr_[i] ); }
}
```

```
void DisjointSets::unionBySize(int root1, int root2) {
  int newSize = arr_[root1] + arr_[root2];

  // If arr_[root1] is less than (more negative), it is the larger set;
  // we union the smaller set, root2, with root1.
  if ( arr_[root1] < arr_[root2] ) {
    arr_[root2] = root1;
    arr_[root1] = newSize;
  }

  // Otherwise, do the opposite:
  else {
    arr_[root1] = root2;
    arr_[root2] = newSize;
  }
}
```

Path Compression



Disjoint Sets Analysis

The **iterated log** function:

The number of times you can take a log of a number.

log*(n) =

0 , $n \leq 1$

1 + log*(log(n)) , $n > 1$

What is **lg*(2^{65536})**?

Disjoint Sets Analysis

In an Disjoint Sets implemented with smart **unions** and path compression on **find**:

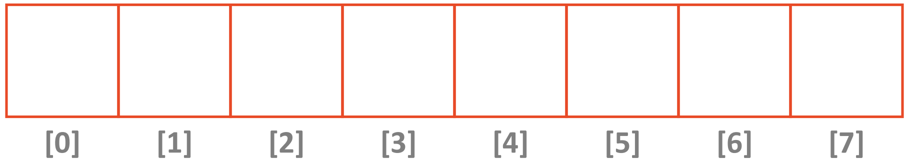
Any sequence of **m** **union** and **find** operations result in the worse case running time of O(______________),

where **n** is the number of items in the Disjoint Sets.

In Review: Data Structures

Array
- Sorted Array
- Unsorted Array
  - Stacks
  - Queues
  - Hashing
  - Heaps
    - Priority Queues
  - UpTrees
    - Disjoint Sets

List
- Doubly Linked List
- Skip List
- Trees
  - BTree
  - Binary Tree
    - Huffman Encoding
    - kd-Tree
    - AVL Tree



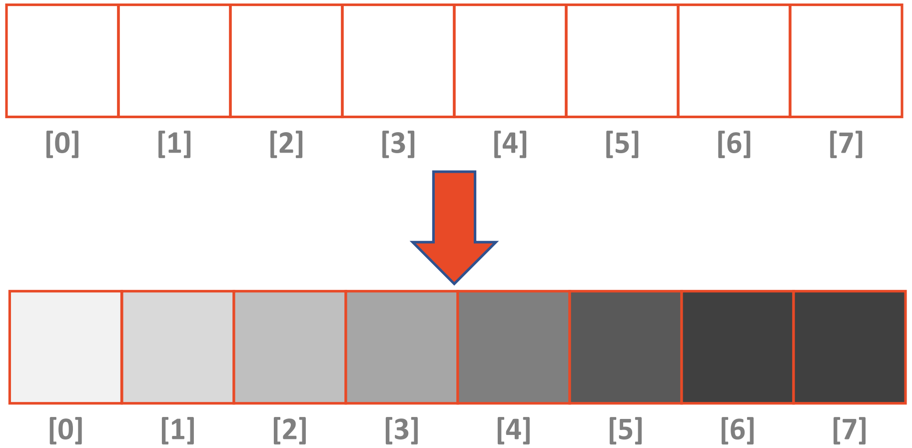
Array

- Constant time access to any element, given an index

  a[k] is accessed in O(1) time, no matter how large the array grows

- Cache-optimized

  Many modern systems cache or pre-fetch nearby memory values due the "Principle of Locality". Therefore, arrays often perform faster than lists in identical operations.



Array

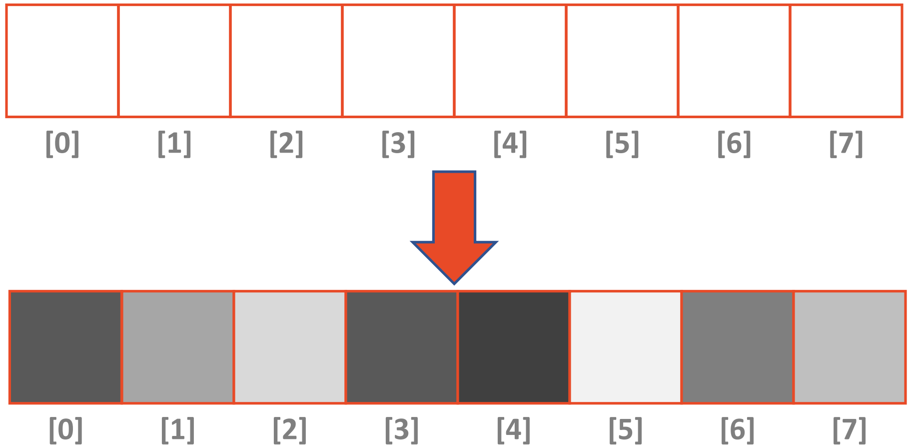
Sorted Array

- Efficient general search structure

  Searches on the sort property run in O(lg(n)) with Binary Search

- Inefficient insert/remove

  Elements must be inserted and removed at the location dictated by the sort property, resulting shifting the array in memory – an O(n) operation



Array

Unsorted Array

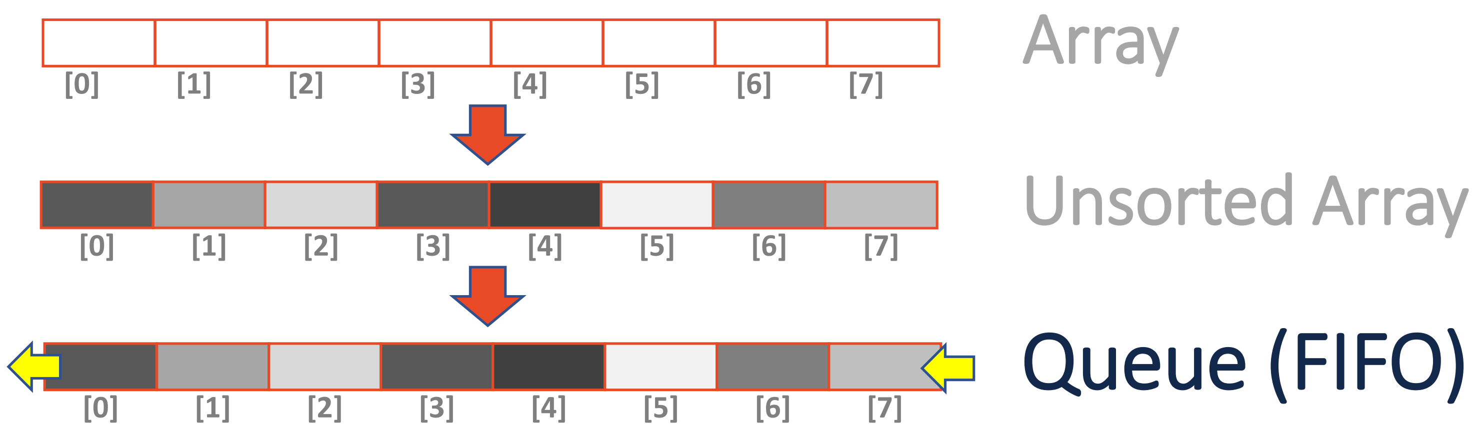
- Constant time add/remove at the beginning/end

  Amortized O(1) insert and remove from the front and of the array

  <u>Idea:</u> Double on resize

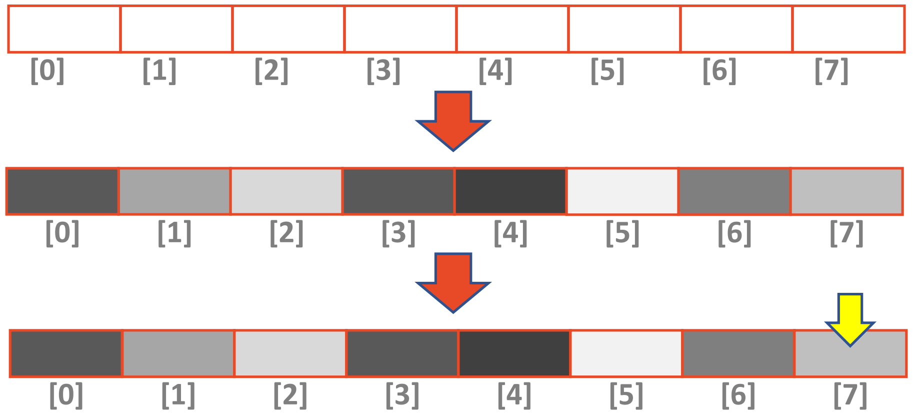
- Inefficient global search structure

  With no sort property, all searches must iterate the entire array; O(1) time



- First In First Out (FIFO) ordering of data
  Maintains an arrival ordering of tasks, jobs, or data

- All ADT operations are constant time operations
  enqueue() and dequeue() both run in O(1) time



Array

Unsorted Array

Stack (LIFO)

- Last In First Out (LIFO) ordering of data

  Maintains a "most recently added" list of data

- All ADT operations are constant time operations

  push() and pop() both run in O(1) time

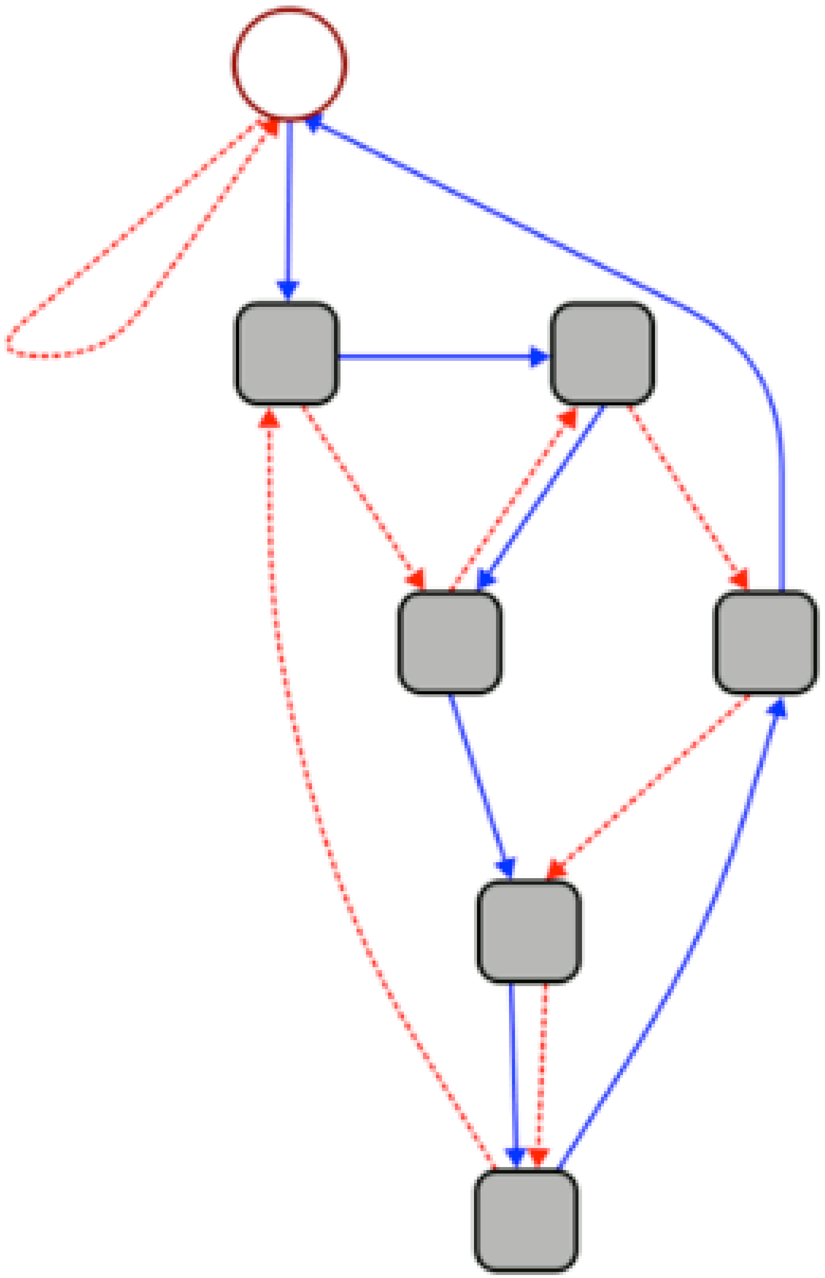
Wolfram|Alpha's "Personal Analytics“ for Facebook

Generated: April 2013 using Wade Fagen-Ulmschneider's Profile Data



This graph can be used to quickly calculate whether a given number is divisible by 7.

1. Start at the circle node at the top.
2. For each digit **d** in the given number, follow **d** blue (solid) edges in succession. As you move from one digit to the next, follow **1** red (dashed) edge.
3. If you end up back at the circle node, your number is divisible by 7.

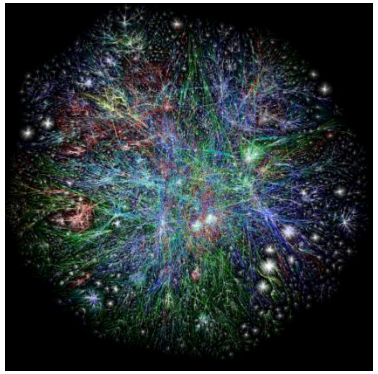
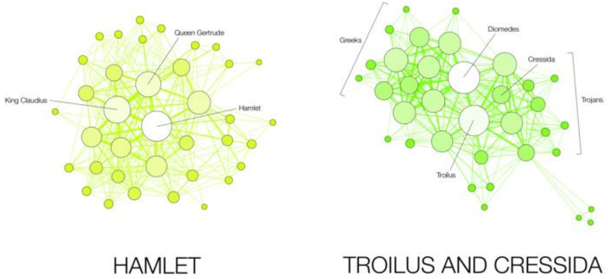
Graphs





To study all of these structures:

1. A common vocabulary
2. Graph implementations
3. Graph traversals
4. Graph algorithms
