BTree Properties

For a BTree of order **m**:

1. All keys within a node are ordered.
2. All leaves contain no more than **m-1** nodes.
3. All internal nodes have exactly **one more child than key**.
4. Root nodes can be a leaf or have **[2, m]** children.
5. All non-root, internal nodes have **[ceil(m/2), m]** children.
6. All leaves are on the same level.

BTree Proof #1

In our AVL Analysis, we saw finding an **upper bound** on the height (**h** given **n,** aka **h = f(n)**) is the same as finding a **lower bound** on the keys (**n** given **h,** aka $\mathbf{f^{-1}(h)}$).

Goal: We want to find a relationship for BTrees between the number of keys (**n**) and the height (**h**).

BTree Strategy:

1. Define a function that counts the minimum number of nodes in a BTree of a given order.
    a. Account for the minimum number of keys per node.
2. Proving a minimum number of nodes provides us with an upper-bound for the maximum possible height.

Proof:

1a. The minimum number of nodes for a BTree of order **m** at each level is as follows:

root:

level 1:

level 2:

level 3:

…

level h:

1b. The minimum total number of nodes is the sum of all levels:

---

2. The minimum number of keys:

---

3. Finally, we show an upper-bound on height:

So, how good are BTrees?

Given a BTree of order 101, how much can we store in a tree of height=4?

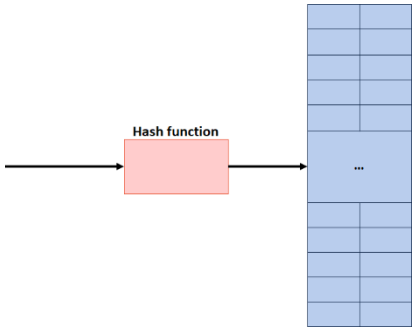
Minimum:

Maximum:

Goals for Understanding Hashing:

1. We will define a **keyspace**, a (mathematical) description of the keys for a set of data.

2. We will define a function used to map the **keyspace** into a small set of integers.



All hash tables consists of three things:

1.

2.

3.

A Perfect Hash Function

(Angrave, CS 241)
(Beckman, CS 421)
(Cunningham, CS 210)
(Davis, CS 101)
(Evans, CS 126)
(Fagen-Ulmschneider, CS 225)
(Gunter, CS 422)
(Herman, CS 233)

All hash functions will consist of two parts:

- A **hash**:
- A **compression**:

Characteristics of a good hash function:

1. Computation Time:

2. Deterministic:

3. SUHA:

Towards a general-purpose hashing function:
It is easy to create a general-purpose hashing function when the keyspace is proportional to the table size:

- **Ex:** Professors at CS@Illinois
- **Ex:** Anything you can reason about every possible value

It is difficult to create a general-purpose hashing function when the keyspace is large:

CS 225 – Things To Be Doing:

1. Programming Exam B is live!
2. MP5 has been released; EC+7 deadline is Monday back from break
3. lab_btree released today
4. Daily POTDs are ongoing!
