

# Disjoint Sets

# Learning Objectives

---

1. Consider how to implement the Disjoint Set ADT

# Disjoint Sets ADT

Maintain a collection  $S = \{s_0, s_1, \dots, s_k\}$

Each set has a representative member.

API: **void makeSets(int number);**

**void union(int k1, int k2);**

**int find(int k);**

# Implementation #1

0 1 4

2 7

3 5 6

0	1	2	3	4	5	6	7

Find(k):

Union(k1, k2):

# Implementation #2

0 1 4

2 7

3 5 6

0	1	2	3	4	5	6	7

Find(k):

Union(k1, k2):

# Implementation #2

0 1 4

2 7

3 5 6

0	1	2	3	4	5	6	7

```
1 int DisjointSets::find(int i) {  
2     if ( data[i] < 0 ) { return i; }  
3     else { return find( data[i] ); }  
4 }
```

We will continue to use an array where the index is the key

The value of the array is:

- **-1**, if we have found the representative element
- **The index of the parent**, if we haven't found the rep. element

We will call these **UpTrees**:

0	1	2	3
-1	-1	-1	-1
