Prove that the following languages are undecidable.

1. AcceptIllini := $\{\langle M \rangle \mid M$ accepts the string **ILLINI**$\}$

   Solution: For the sake of argument, suppose there is an algorithm DecideAcceptIllini that correctly decides the language AcceptIllini. Then we can solve the halting problem as follows:

```
DecideHalt(⟨M,w⟩):
  Encode the following Turing machine M′:
      M′(x):
        run M on input w
        return True
  if DecideAcceptIllini(⟨M′⟩)
      return True
  else
      return False
```

   We prove this reduction correct as follows:

   $\Longrightarrow$ Suppose M halts on input w.
   Then M' accepts *every* input string x.
   In particular, M' accepts the string **ILLINI**.
   So DecideAcceptIllini accepts the encoding $\langle M' \rangle$.
   So DecideHalt correctly accepts the encoding $\langle M, w \rangle$.

   $\Longleftarrow$ Suppose M does not halt on input w.
   Then M' diverges on *every* input string x.
   In particular, M' does not accept the string **ILLINI**.
   So DecideAcceptIllini rejects the encoding $\langle M' \rangle$.
   So DecideHalt correctly rejects the encoding $\langle M, w \rangle$.

   In both cases, DecideHalt is correct. But that's impossible, because Halt is undecidable. We conclude that the algorithm DecideAcceptIllini does not exist. ■

   As usual for undecidablility proofs, this proof invokes *four* distinct Turing machines:

   - The hypothetical algorithm DecideAcceptIllini.
   - The new algorithm DecideHalt that we construct in the solution.
   - The arbitrary machine M whose encoding is part of the input to DecideHalt.
   - The special machine M' whose encoding DecideHalt constructs (from the encoding of M and w) and then passes to DecideAcceptIllini.

2. AcceptThree := $\{\langle M\rangle \mid M \text{ accepts exactly three strings}\}$

Solution: For the sake of argument, suppose there is an algorithm DecideAcceptThree that correctly decides the language AcceptThree. Then we can solve the halting problem as follows:

```
DecideHalt(⟨M, w⟩):
  Encode the following Turing machine M':
      M'(x):
        run M on input w
        if x = ε or x = 0 or x = 1
            return True
        else
            return False
  if DecideAcceptThree(⟨M'⟩)
      return True
  else
      return False
```

We prove this reduction correct as follows:

$\Longrightarrow$ Suppose M halts on input w.
Then M' accepts exactly three strings: ε, **0**, and **1**.
So DecideAcceptThree accepts the encoding $\langle M'\rangle$.
So DecideHalt correctly accepts the encoding $\langle M, w\rangle$.

$\Longleftarrow$ Suppose M does not halt on input w.
Then M' diverges on *every* input string x.
In particular, M' does not accept exactly three strings (because $0 \neq 3$).
So DecideAcceptThree rejects the encoding $\langle M'\rangle$.
So DecideHalt correctly rejects the encoding $\langle M, w\rangle$.

In both cases, DecideHalt is correct. But that's impossible, because Halt is undecidable. We conclude that the algorithm DecideAcceptThree does not exist. ■

3. AcceptPalindrome $:= \big\{\langle M\rangle \;\big|\; M$ accepts at least one palindrome$\big\}$

Solution: For the sake of argument, suppose there is an algorithm DecideAcceptPalindrome that correctly decides the language AcceptPalindrome. Then we can solve the halting problem as follows:

```
DecideHalt(⟨M, w⟩):
  Encode the following Turing machine M′:
      M′(x):
        run M on input w
        return True
    if DecideAcceptPalindrome(⟨M′⟩)
        return True
    else
        return False
```

We prove this reduction correct as follows:

$\Longrightarrow$ Suppose M halts on input w.
Then M' accepts *every* input string x.
In particular, M' accepts the palindrome **RACECAR**.
So DecideAcceptPalindrome accepts the encoding $\langle M'\rangle$.
So DecideHalt correctly accepts the encoding $\langle M, w\rangle$.

$\Longleftarrow$ Suppose M does not halt on input w.
Then M' diverges on *every* input string x.
In particular, M' does not accept any palindromes.
So DecideAcceptPalindrome rejects the encoding $\langle M'\rangle$.
So DecideHalt correctly rejects the encoding $\langle M, w\rangle$.

In both cases, DecideHalt is correct. But that's impossible, because Halt is undecidable. We conclude that the algorithm DecideAcceptPalindrome does not exist.

Yes, this is ***exactly*** the same proof as for problem 1. ■
