LaTeXed: January 22, 2019 01:36

Part I

DFA Introduction

DFAs also called Finite State Machines (FSMs)

- The “simplest” model for computers?
- State machines that are common in practice.
 - Vending machines
 - Elevators
 - Digital watches
 - Simple network protocols
- Programs with fixed memory

A simple program

Program to check if a given input string w has odd length

```
int  $n = 0$ 
While input is not finished
  read next character  $c$ 
   $n \leftarrow n + 1$ 
endWhile
If ( $n$  is odd) output YES
Else output NO
```

A simple program

Program to check if a given input string w has odd length

```
int  $n = 0$ 
While input is not finished
  read next character  $c$ 
   $n \leftarrow n + 1$ 
endWhile
If ( $n$  is odd) output YES
Else output NO
```

```
bit  $x = 0$ 
While input is not finished
  read next character  $c$ 
   $x \leftarrow \text{flip}(x)$ 
endWhile
If ( $x = 1$ ) output YES
Else output NO
```

Another view

- Machine has input written on a *read-only* tape
- Start in specified start state
- Start at left, scan symbol, change state and move right
- Circled states are *accepting*
- Machine *accepts* input string if it is in an accepting state after scanning the last symbol.

Graphical Representation/State Machine

- Directed graph with nodes representing **states** and edge/arcs representing **transitions** labeled by symbols in Σ
- For each state (vertex) q and symbol $a \in \Sigma$ there is *exactly* one outgoing edge labeled by a
- Initial/start state has a pointer (or labeled as s , q_0 or “start”)
- Some states with double circles labeled as accepting/final states

Graphical Representation

- Where does **001** lead? **10010**?

Graphical Representation

- Where does **001** lead? **10010**?
- Which strings end up in accepting state?

0110 ✓

1100

$(10 + 01)^*$

Graphical Representation

- Where does **001** lead? **10010**?
- Which strings end up in accepting state?
- Can you prove it?

Graphical Representation

- Where does **001** lead? **10010**?
- Which strings end up in accepting state?
- Can you prove it?
- Every string w has a unique walk that it follows from a given state q by reading one letter of w from left to right.

Graphical Representation

Definition

A DFA M accepts a string w iff the unique walk starting at the start state and spelling out w ends in an accepting state.

Graphical Representation

Definition

A DFA M accepts a string w iff the unique walk starting at the start state and spelling out w ends in an accepting state.

Definition

The language accepted (or recognized) by a DFA M is denoted by $L(M)$ and defined as: $L(M) = \{w \mid M \text{ accepts } w\}$.

Warning

“ M accepts language L ” **does not mean** simply that that M accepts each string in L .

It means that M accepts each string in L **and no others**. Equivalently M accepts each string in L and **does not accept/rejects** strings in $\Sigma^* \setminus L$.

Warning

“ M accepts language L ” **does not mean** simply that that M accepts each string in L .

It means that M accepts each string in L **and no others**. Equivalently M accepts each string in L and **does not accept/rejects** strings in $\Sigma^* \setminus L$.

M “recognizes” L is a better term but “accepts” is widely accepted (and recognized) (joke attributed to Lenny Pitt)

Formal Tuple Notation

Definition

A **deterministic finite automata (DFA)** $M = (Q, \Sigma, \delta, s, A)$ is a five tuple where

Formal Tuple Notation

Definition

A **deterministic finite automata (DFA)** $M = (Q, \Sigma, \delta, s, A)$ is a five tuple where

- Q is a finite set whose elements are called **states**,

Formal Tuple Notation

Definition

A **deterministic finite automata (DFA)** $M = (Q, \Sigma, \delta, s, A)$ is a five tuple where

- Q is a finite set whose elements are called **states**,
- Σ is a finite set called the **input alphabet**,

Formal Tuple Notation

Definition

A **deterministic finite automata (DFA)** $M = (Q, \Sigma, \delta, s, A)$ is a five tuple where

- Q is a finite set whose elements are called **states**,
- Σ is a finite set called the **input alphabet**,
- $\delta : Q \times \Sigma \rightarrow Q$ is the **transition function**,

Formal Tuple Notation

Definition

- $A \subseteq Q$ is the set of **accepting/final** states.

Formal Tuple Notation

Definition

A **deterministic finite automata (DFA)** $M = (Q, \Sigma, \delta, s, A)$ is a five tuple where

- Q is a finite set whose elements are called **states**,
- Σ is a finite set called the **input alphabet**,
- $\delta : Q \times \Sigma \rightarrow Q$ is the **transition function**,
- $s \in Q$ is the **start state**,
- $A \subseteq Q$ is the set of **accepting/final** states.

Common alternate notation: q_0 for start state, F for final states.

DFA Notation

$$M = \left(\overbrace{Q}^{\text{set of all states}}, \underbrace{\Sigma}_{\text{alphabet}}, \overbrace{\delta}^{\text{transition func}}, \underbrace{s}_{\text{start state}}, \overbrace{A}^{\text{set of all accept states}} \right)$$

Example

- $Q =$

Example

- $Q = \{q_0, q_1, q_1, q_3\}$

Example

- $Q = \{q_0, q_1, q_1, q_3\}$
- $\Sigma =$

Example

- $Q = \{q_0, q_1, q_1, q_3\}$
- $\Sigma = \{0, 1\}$

Example

- $Q = \{q_0, q_1, q_1, q_3\}$
- $\Sigma = \{0, 1\}$
- δ

Example

- $Q = \{q_0, q_1, q_1, q_3\}$
- $\Sigma = \{0, 1\}$
- δ
- $s =$

Example

- $Q = \{q_0, q_1, q_1, q_3\}$
- $\Sigma = \{0, 1\}$
- δ
- $s = q_0$

Example

- $Q = \{q_0, q_1, q_1, q_3\}$
- $\Sigma = \{0, 1\}$
- δ
- $s = q_0$
- $A =$

Example

- $Q = \{q_0, q_1, q_1, q_3\}$
- $\Sigma = \{0, 1\}$
- δ
- $s = q_0$
- $A = \{q_0\}$

q	0	1
q_0	q	
q_1		
q_2		
q_3		

Extending the transition function to strings

Given DFA $M = (Q, \Sigma, \delta, s, A)$, $\delta(q, a)$ is the state that M goes to from q on reading letter a

Useful to have notation to specify the unique state that M will reach from q on reading *string* w

Extending the transition function to strings

Given DFA $M = (Q, \Sigma, \delta, s, A)$, $\delta(q, a)$ is the state that M goes to from q on reading letter a

Useful to have notation to specify the unique state that M will reach from q on reading *string* w

Transition function $\delta^* : Q \times \Sigma^* \rightarrow Q$ defined inductively as follows:

- $\delta^*(q, w) = q$ if $w = \epsilon$
- $\delta^*(q, w) = \delta^*(\delta(q, a), x)$ if $w = ax$.

Formal definition of language accepted by **M**

Definition

The language $L(M)$ accepted by a DFA $M = (Q, \Sigma, \delta, s, A)$ is

$$\{w \in \Sigma^* \mid \delta^*(s, w) \in A\}.$$

Example

What is:

- $\delta^*(q_1, \epsilon)$ q_1
- $\delta^*(q_0, 1011)$ q_2
- $\delta^*(q_1, 010)$ q_0
- $\delta^*(q_4, 10)$

Example continued

$0(01+10)^*$

- What is $L(M)$ if start state is changed to q_1 ?
- What is $L(M)$ if final/accept states are set to $\{q_2, q_3\}$ instead of $\{q_0\}$?

Advantages of formal specification

- Necessary for proofs
- Necessary to specify abstractly for class of languages

Exercise: Prove by induction that for any two strings u, v , any state q , $\delta^*(q, uv) = \delta^*(\delta^*(q, u), v)$.

Part II

Constructing DFAs

DFAs: State = Memory

How do we design a **DFA** M for a given language L ? That is $L(M) = L$.

- **DFA** is like a program that has fixed amount of memory independent of input size.
- The memory of a **DFA** is encoded in its states
- The state/memory must capture enough information from the input seen so far that it is sufficient for the suffix that is yet to be seen (note that **DFA** cannot go back)

DFA Construction: Example

Assume $\Sigma = \{0, 1\}$

- $L = \emptyset$, $L = \Sigma^*$, $L = \{\epsilon\}$, $L = \{0\}$.

DFA Construction: Example

Assume $\Sigma = \{0, 1\}$

- $L = \emptyset$, $L = \Sigma^*$, $L = \{\epsilon\}$, $L = \{0\}$.
- $L = \{w \in \{0, 1\}^* \mid |w| \text{ is divisible by } 5\}$

DFA Construction: Example

Assume $\Sigma = \{0, 1\}$

- $L = \emptyset$, $L = \Sigma^*$, $L = \{\epsilon\}$, $L = \{0\}$.
- $L = \{w \in \{0, 1\}^* \mid |w| \text{ is divisible by } 5\}$
- $L = \{w \in \{0, 1\}^* \mid w \text{ ends with } 01\}$

DFA Construction: Example

Assume $\Sigma = \{0, 1\}$

- $L = \emptyset$, $L = \Sigma^*$, $L = \{\epsilon\}$, $L = \{0\}$.
- $L = \{w \in \{0, 1\}^* \mid |w| \text{ is divisible by } 5\}$
- $L = \{w \in \{0, 1\}^* \mid w \text{ ends with } 01\}$
- $L = \{w \in \{0, 1\}^* \mid w \text{ contains } 001 \text{ as substring}\}$

DFA Construction: Example

Assume $\Sigma = \{0, 1\}$

- $L = \emptyset, L = \Sigma^*, L = \{\epsilon\}, L = \{0\}$.
- $L = \{w \in \{0, 1\}^* \mid |w| \text{ is divisible by } 5\}$
- $L = \{w \in \{0, 1\}^* \mid w \text{ ends with } 01\}$
- $L = \{w \in \{0, 1\}^* \mid w \text{ contains } 001 \text{ as substring}\}$
- $L = \{w \in \{0, 1\}^* \mid w \text{ contains } 001 \text{ or } 010 \text{ as substring}\}$

DFA Construction: Example

Assume $\Sigma = \{0, 1\}$

- $L = \emptyset, L = \Sigma^*, L = \{\epsilon\}, L = \{0\}$.
- $L = \{w \in \{0, 1\}^* \mid |w| \text{ is divisible by } 5\}$
- $L = \{w \in \{0, 1\}^* \mid w \text{ ends with } 01\}$
- $L = \{w \in \{0, 1\}^* \mid w \text{ contains } 001 \text{ as substring}\}$
- $L = \{w \in \{0, 1\}^* \mid w \text{ contains } 001 \text{ or } 010 \text{ as substring}\}$
- $L = \{w \mid w \text{ has a } 1 \text{ } k \text{ positions from the end}\}$

DFA Construction: Example

$L = \{\text{Binary numbers congruent to } 0 \pmod{5}\}$

Example: $1101011 = 107 = 2 \pmod{5}$, $1010 = 10 = 0 \pmod{5}$

DFA Construction: Example

$L = \{\text{Binary numbers congruent to } 0 \pmod{5}\}$

Example: $1101011 = 107 = 2 \pmod{5}$, $1010 = 10 = 0 \pmod{5}$

Key observation:

$w0 \pmod{5} = a$ implies

$w0 \pmod{5} = 2a \pmod{5}$ and $w1 \pmod{5} = (2a + 1) \pmod{5}$

$$q_0 \dots q_4$$
$$0 \dots 4$$

$$\delta(q, 0) = 2q \pmod{5}$$
$$\delta(q, 1) = 2q + 1 \pmod{5}$$

Part III

Product Construction and Closure Properties

Part IV

Complement

Complement

Question: If M is a DFA, is there a DFA M' such that $L(M') = \Sigma^* \setminus L(M)$? That is, are languages recognized by DFAs closed under complement?

Complement

Example...

Just flip the state of the states!

$(0,1 \leftrightarrow 1,0)$

Complement

Theorem

*Languages accepted by **DFA**s are closed under complement.*

Complement

Theorem

Languages accepted by DFAs are closed under complement.

Proof.

Let $M = (Q, \Sigma, \delta, s, A)$ such that $L = L(M)$.

Let $M' = (Q, \Sigma, \delta, s, Q \setminus A)$. Claim: $L(M') = \bar{L}$. Why?

Complement

Theorem

Languages accepted by **DFA**s are closed under complement.

Proof.

Let $M = (Q, \Sigma, \delta, s, A)$ such that $L = L(M)$.

Let $M' = (Q, \Sigma, \delta, s, Q \setminus A)$. Claim: $L(M') = \bar{L}$. Why?

$\delta_M^* = \delta_{M'}^*$. Thus, for every string w , $\delta_M^*(s, w) = \delta_{M'}^*(s, w)$.

$\delta_M^*(s, w) \in A \Rightarrow \delta_{M'}^*(s, w) \notin Q \setminus A$.

$\delta_M^*(s, w) \notin A \Rightarrow \delta_{M'}^*(s, w) \in Q \setminus A$. □

Part V

Product Construction

Union and Intersection

Question: Are languages accepted by **DFA**s closed under union?

That is, given **DFA**s M_1 and M_2 is there a **DFA** that accepts

$L(M_1) \cup L(M_2)$?

How about intersection $L(M_1) \cap L(M_2)$?

Union and Intersection

Question: Are languages accepted by **DFA**s closed under union?

That is, given **DFA**s M_1 and M_2 is there a **DFA** that accepts $L(M_1) \cup L(M_2)$?

How about intersection $L(M_1) \cap L(M_2)$?

Idea from programming: on input string w

- Simulate M_1 on w
- Simulate M_2 on w
- If both accept then $w \in L(M_1) \cap L(M_2)$. If at least one accepts then $w \in L(M_1) \cup L(M_2)$.

Union and Intersection

Question: Are languages accepted by **DFA**s closed under union?

That is, given **DFA**s M_1 and M_2 is there a **DFA** that accepts $L(M_1) \cup L(M_2)$?

How about intersection $L(M_1) \cap L(M_2)$?

Idea from programming: on input string w

- Simulate M_1 on w
- Simulate M_2 on w
- If both accept then $w \in L(M_1) \cap L(M_2)$. If at least one accepts then $w \in L(M_1) \cup L(M_2)$.
- **Catch:** We want a single **DFA** M that can only read w once.

Union and Intersection

Question: Are languages accepted by **DFA**s closed under union? That is, given **DFA**s M_1 and M_2 is there a **DFA** that accepts $L(M_1) \cup L(M_2)$?

How about intersection $L(M_1) \cap L(M_2)$?

Idea from programming: on input string w

- Simulate M_1 on w
- Simulate M_2 on w
- If both accept then $w \in L(M_1) \cap L(M_2)$. If at least one accepts then $w \in L(M_1) \cup L(M_2)$.
- **Catch:** We want a single **DFA** M that can only read w once.
- **Solution:** Simulate M_1 and M_2 in **parallel** by keeping track of states of *both* machines

Example

Example

M_1 accepts #0 = odd

M_2 accepts #1 = odd

Example

M_1 accepts #0 = odd

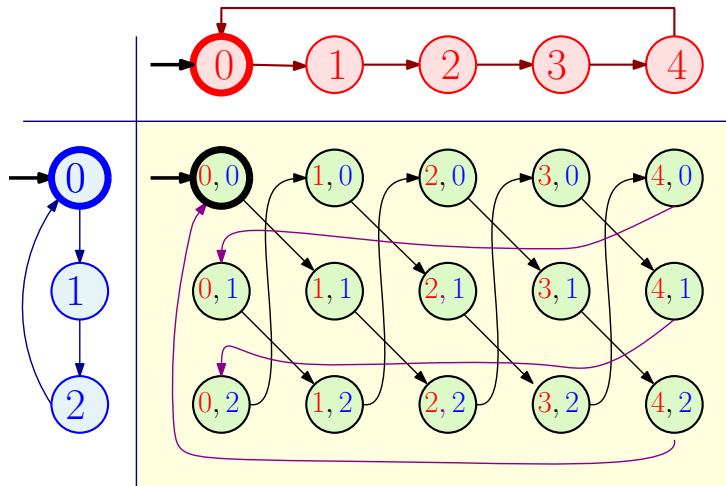

M_2 accepts #1 = odd

Cross-product machine

Example II

Accept all binary strings of length divisible by 3 and 5

Assume all edges are labeled by **0, 1**.

Product construction for intersection

$M_1 = (Q_1, \Sigma, \delta_1, s_1, A_1)$ and $M_2 = (Q_2, \Sigma, \delta_2, s_2, A_2)$

Create $M = (Q, \Sigma, \delta, s, A)$ where

Product construction for intersection

$$M_1 = (Q_1, \Sigma, \delta_1, s_1, A_1) \text{ and } M_2 = (Q_2, \Sigma, \delta_2, s_2, A_2)$$

Create $M = (Q, \Sigma, \delta, s, A)$ where

- $Q =$

Product construction for intersection

$M_1 = (Q_1, \Sigma, \delta_1, s_1, A_1)$ and $M_2 = (Q_2, \Sigma, \delta_2, s_2, A_2)$

Create $M = (Q, \Sigma, \delta, s, A)$ where

- $Q = Q_1 \times Q_2 = \{(q_1, q_2) \mid q_1 \in Q_1, q_2 \in Q_2\}$

Product construction for intersection

$M_1 = (Q_1, \Sigma, \delta_1, s_1, A_1)$ and $M_2 = (Q_2, \Sigma, \delta_2, s_2, A_2)$

Create $M = (Q, \Sigma, \delta, s, A)$ where

- $Q = Q_1 \times Q_2 = \{(q_1, q_2) \mid q_1 \in Q_1, q_2 \in Q_2\}$
- $s =$

Product construction for intersection

$$M_1 = (Q_1, \Sigma, \delta_1, s_1, A_1) \text{ and } M_2 = (Q_2, \Sigma, \delta_2, s_2, A_2)$$

Create $M = (Q, \Sigma, \delta, s, A)$ where

- $Q = Q_1 \times Q_2 = \{(q_1, q_2) \mid q_1 \in Q_1, q_2 \in Q_2\}$
- $s = (s_1, s_2)$

Product construction for intersection

$M_1 = (Q_1, \Sigma, \delta_1, s_1, A_1)$ and $M_2 = (Q_2, \Sigma, \delta_2, s_2, A_2)$

Create $M = (Q, \Sigma, \delta, s, A)$ where

- $Q = Q_1 \times Q_2 = \{(q_1, q_2) \mid q_1 \in Q_1, q_2 \in Q_2\}$
- $s = (s_1, s_2)$
- $\delta : Q \times \Sigma \rightarrow Q$ where

$$\delta((q_1, q_2), a) =$$

Product construction for intersection

$$M_1 = (Q_1, \Sigma, \delta_1, s_1, A_1) \text{ and } M_2 = (Q_2, \Sigma, \delta_2, s_2, A_2)$$

Create $M = (Q, \Sigma, \delta, s, A)$ where

- $Q = Q_1 \times Q_2 = \{(q_1, q_2) \mid q_1 \in Q_1, q_2 \in Q_2\}$
- $s = (s_1, s_2)$
- $\delta : Q \times \Sigma \rightarrow Q$ where

$$\delta((q_1, q_2), a) = (\delta_1(q_1, a), \delta_2(q_2, a))$$

Product construction for intersection

$M_1 = (Q_1, \Sigma, \delta_1, s_1, A_1)$ and $M_2 = (Q_2, \Sigma, \delta_2, s_2, A_2)$

Create $M = (Q, \Sigma, \delta, s, A)$ where

- $Q = Q_1 \times Q_2 = \{(q_1, q_2) \mid q_1 \in Q_1, q_2 \in Q_2\}$
- $s = (s_1, s_2)$
- $\delta : Q \times \Sigma \rightarrow Q$ where

$$\delta((q_1, q_2), a) = (\delta_1(q_1, a), \delta_2(q_2, a))$$

- $A =$

Product construction for intersection

$M_1 = (Q_1, \Sigma, \delta_1, s_1, A_1)$ and $M_2 = (Q_2, \Sigma, \delta_2, s_2, A_2)$

Create $M = (Q, \Sigma, \delta, s, A)$ where

- $Q = Q_1 \times Q_2 = \{(q_1, q_2) \mid q_1 \in Q_1, q_2 \in Q_2\}$
- $s = (s_1, s_2)$
- $\delta : Q \times \Sigma \rightarrow Q$ where

$$\delta((q_1, q_2), a) = (\delta_1(q_1, a), \delta_2(q_2, a))$$

- $A = A_1 \times A_2 = \{(q_1, q_2) \mid q_1 \in A_1, q_2 \in A_2\}$

Product construction for intersection

$M_1 = (Q_1, \Sigma, \delta_1, s_1, A_1)$ and $M_2 = (Q_2, \Sigma, \delta_2, s_2, A_2)$

Create $M = (Q, \Sigma, \delta, s, A)$ where

- $Q = Q_1 \times Q_2 = \{(q_1, q_2) \mid q_1 \in Q_1, q_2 \in Q_2\}$
- $s = (s_1, s_2)$
- $\delta : Q \times \Sigma \rightarrow Q$ where

$$\delta((q_1, q_2), a) = (\delta_1(q_1, a), \delta_2(q_2, a))$$

- $A = A_1 \times A_2 = \{(q_1, q_2) \mid q_1 \in A_1, q_2 \in A_2\}$

Theorem

$$L(M) = L(M_1) \cap L(M_2).$$

Correctness of construction

Lemma

For each string w , $\delta^*(s, w) = (\delta_1^*(s_1, w), \delta_2^*(s_2, w))$.

Correctness of construction

Lemma

For each string w , $\delta^*(s, w) = (\delta_1^*(s_1, w), \delta_2^*(s_2, w))$.

Exercise: Assuming lemma prove the theorem in previous slide.

Correctness of construction

Lemma

For each string w , $\delta^*(s, w) = (\delta_1^*(s_1, w), \delta_2^*(s_2, w))$.

Exercise: Assuming lemma prove the theorem in previous slide.
Proof of lemma by induction on $|w|$

Product construction for union

$M_1 = (Q_1, \Sigma, \delta_1, s_1, A_1)$ and $M_2 = (Q_2, \Sigma, \delta_2, s_2, A_2)$

Create $M = (Q, \Sigma, \delta, s, A)$ where

- $Q = Q_1 \times Q_2 = \{(q_1, q_2) \mid q_1 \in Q_1, q_2 \in Q_2\}$
- $s = (s_1, s_2)$
- $\delta : Q \times \Sigma \rightarrow Q$ where

$$\delta((q_1, q_2), a) = (\delta_1(q_1, a), \delta_2(q_2, a))$$

- $A =$

Product construction for union

$M_1 = (Q_1, \Sigma, \delta_1, s_1, A_1)$ and $M_2 = (Q_2, \Sigma, \delta_2, s_2, A_2)$

Create $M = (Q, \Sigma, \delta, s, A)$ where

- $Q = Q_1 \times Q_2 = \{(q_1, q_2) \mid q_1 \in Q_1, q_2 \in Q_2\}$
- $s = (s_1, s_2)$
- $\delta : Q \times \Sigma \rightarrow Q$ where

$$\delta((q_1, q_2), a) = (\delta_1(q_1, a), \delta_2(q_2, a))$$

- $A = \{(q_1, q_2) \mid q_1 \in A_1 \text{ or } q_2 \in A_2\}$

Theorem

$$L(M) = L(M_1) \cup L(M_2).$$

Set Difference

Theorem

M_1, M_2 DFAs. There is a DFA M such that $L(M) = L(M_1) \setminus L(M_2)$.

Exercise: Prove the above using two methods.

- Using a direct product construction
- Using closure under complement and intersection and union
