

# Polynomial Time Reductions

## Lecture 22

April 18

LaTeXed: April 16, 2019 21:23

# Part I

## (Polynomial Time) Reductions

# Reductions

A reduction from Problem  $X$  to Problem  $Y$  means (informally) that if we have an algorithm for Problem  $Y$ , we can use it to find an algorithm for Problem  $X$ .

# Reductions

A reduction from Problem  $X$  to Problem  $Y$  means (informally) that if we have an algorithm for Problem  $Y$ , we can use it to find an algorithm for Problem  $X$ .

## Using Reductions

- 1 We use reductions to find algorithms to solve problems.

# Reductions

A reduction from Problem  $X$  to Problem  $Y$  means (informally) that if we have an algorithm for Problem  $Y$ , we can use it to find an algorithm for Problem  $X$ .

## Using Reductions

- 1 We use reductions to find algorithms to solve problems.
- 2 We also use reductions to show that we **can't** find algorithms for some problems. (We say that these problems are **hard**.)

# Reductions for decision problems/languages

For languages  $L_X, L_Y$ , a **reduction from  $L_X$  to  $L_Y$**  is:

- 1 An algorithm ...
- 2 Input:  $w \in \Sigma^*$
- 3 Output:  $w' \in \Sigma^*$
- 4 Such that:

$$\boxed{w \in L_Y} \iff \boxed{w' \in L_X}$$

# Reductions for decision problems/languages

For languages  $L_X, L_Y$ , a **reduction from  $L_X$  to  $L_Y$**  is:

- 1 An algorithm ...
- 2 Input:  $w \in \Sigma^*$
- 3 Output:  $w' \in \Sigma^*$
- 4 Such that:

$$\boxed{w \in L_Y} \iff \boxed{w' \in L_X}$$

(Actually, this is only one type of reduction, but this is the one we'll use most often.) There are other kinds of reductions.

# Reductions for decision problems/languages

For decision problems  $X, Y$ , a **reduction from  $X$  to  $Y$**  is:

- 1 An algorithm ...
- 2 Input:  $I_X$ , an instance of  $X$ .
- 3 Output:  $I_Y$  an instance of  $Y$ .
- 4 Such that:

$$\boxed{I_Y \text{ is YES instance of } Y} \iff \boxed{I_X \text{ is YES instance of } X}$$

# Using reductions to solve problems

- 1  $\mathcal{R}$ : Reduction  $X \rightarrow Y$
- 2  $\mathcal{A}_Y$ : algorithm for  $Y$ :

# Using reductions to solve problems

- 1  $\mathcal{R}$ : Reduction  $X \rightarrow Y$
- 2  $\mathcal{A}_Y$ : algorithm for  $Y$ :
- 3  $\implies$  New algorithm for  $X$ :

```
 $\mathcal{A}_X(I_X)$ :  
    //  $I_X$ : instance of  $X$ .  
     $I_Y \leftarrow \mathcal{R}(I_X)$   
    return  $\mathcal{A}_Y(I_Y)$ 
```

# Using reductions to solve problems

- 1  $\mathcal{R}$ : Reduction  $X \rightarrow Y$
- 2  $\mathcal{A}_Y$ : algorithm for  $Y$ :
- 3  $\implies$  New algorithm for  $X$ :

```
 $\mathcal{A}_X(I_X)$ :  
  //  $I_X$ : instance of  $X$ .  
   $I_Y \leftarrow \mathcal{R}(I_X)$   
  return  $\mathcal{A}_Y(I_Y)$ 
```

If  $\mathcal{R}$  and  $\mathcal{A}_Y$  polynomial-time  $\implies \mathcal{A}_X$  polynomial-time.

# Comparing Problems

- 1 “Problem  $X$  is no harder to solve than Problem  $Y$ ”.
- 2 If Problem  $X$  **reduces to** Problem  $Y$  (we write  $X \leq Y$ ), then  $X$  cannot be harder to solve than  $Y$ .
- 3  $X \leq Y$ :
  - 1  $X$  is no harder than  $Y$ , or
  - 2  $Y$  is at least as hard as  $X$ .

# Part II

## Examples of Reductions

# Independent Sets and Cliques

Given a graph  $G$ , a set of vertices  $V'$  is:

# Independent Sets and Cliques

Given a graph  $G$ , a set of vertices  $V'$  is:

- 1 **independent set**: no two vertices of  $V'$  connected by an edge.

# Independent Sets and Cliques

Given a graph  $G$ , a set of vertices  $V'$  is:

- 1 **independent set**: no two vertices of  $V'$  connected by an edge.
- 2 **clique**: every pair of vertices in  $V'$  is connected by an edge of  $G$ .

# Independent Sets and Cliques

Given a graph  $G$ , a set of vertices  $V'$  is:

- 1 **independent set**: no two vertices of  $V'$  connected by an edge.
- 2 **clique**: every pair of vertices in  $V'$  is connected by an edge of  $G$ .

# Independent Sets and Cliques

Given a graph  $G$ , a set of vertices  $V'$  is:

- 1 **independent set**: no two vertices of  $V'$  connected by an edge.
- 2 **clique**: every pair of vertices in  $V'$  is connected by an edge of  $G$ .

# Independent Sets and Cliques

Given a graph  $G$ , a set of vertices  $V'$  is:

- 1 **independent set**: no two vertices of  $V'$  connected by an edge.
- 2 **clique**: every pair of vertices in  $V'$  is connected by an edge of  $G$ .

# The **Independent Set** and **Clique** Problems

## Problem: **Independent Set**

**Instance:** A graph  $G$  and an integer  $k$ .

**Question:** Does  $G$  has an independent set of size  $\geq k$ ?

# The **Independent Set** and **Clique** Problems

## Problem: **Independent Set**

**Instance:** A graph  $G$  and an integer  $k$ .

**Question:** Does  $G$  has an independent set of size  $\geq k$ ?

## Problem: **Clique**

**Instance:** A graph  $G$  and an integer  $k$ .

**Question:** Does  $G$  has a clique of size  $\geq k$ ?

# Recall

For decision problems  $X$ ,  $Y$ , a reduction from  $X$  to  $Y$  is:

- 1 An algorithm ...
- 2 that takes  $I_X$ , an instance of  $X$  as input ...
- 3 and returns  $I_Y$ , an instance of  $Y$  as output ...
- 4 such that the solution (YES/NO) to  $I_Y$  is the same as the solution to  $I_X$ .

# Reducing **Independent Set** to **Clique**

An instance of **Independent Set** is a graph  $G$  and an integer  $k$ .

# Reducing **Independent Set** to **Clique**

An instance of **Independent Set** is a graph  $G$  and an integer  $k$ .

# Reducing **Independent Set** to **Clique**

An instance of **Independent Set** is a graph  $G$  and an integer  $k$ .

Reduction given  $\langle G, k \rangle$  outputs  $\langle \overline{G}, k \rangle$  where  $\overline{G}$  is the *complement* of  $G$ .  $\overline{G}$  has an edge  $(u, v)$  if and only if  $(u, v)$  is **not** an edge of  $G$ .

# Reducing **Independent Set** to **Clique**

An instance of **Independent Set** is a graph  $G$  and an integer  $k$ .

Reduction given  $\langle G, k \rangle$  outputs  $\langle \overline{G}, k \rangle$  where  $\overline{G}$  is the *complement* of  $G$ .  $\overline{G}$  has an edge  $(u, v)$  if and only if  $(u, v)$  is **not** an edge of  $G$ .

# Reducing **Independent Set** to **Clique**

An instance of **Independent Set** is a graph  $G$  and an integer  $k$ .

Reduction given  $\langle G, k \rangle$  outputs  $\langle \bar{G}, k \rangle$  where  $\bar{G}$  is the *complement* of  $G$ .  $\bar{G}$  has an edge  $(u, v)$  if and only if  $(u, v)$  is **not** an edge of  $G$ .

# Reducing **Independent Set** to **Clique**

An instance of **Independent Set** is a graph  $G$  and an integer  $k$ .

Reduction given  $\langle G, k \rangle$  outputs  $\langle \overline{G}, k \rangle$  where  $\overline{G}$  is the *complement* of  $G$ .  $\overline{G}$  has an edge  $(u, v)$  if and only if  $(u, v)$  is **not** an edge of  $G$ .

# Correctness of reduction

## Lemma

$G$  has an independent set of size  $k$  if and only if  $\overline{G}$  has a clique of size  $k$ .

## Proof.

Need to prove two facts:

$G$  has independent set of size at least  $k$  implies that  $\overline{G}$  has a clique of size at least  $k$ .

$\overline{G}$  has a clique of size at least  $k$  implies that  $G$  has an independent set of size at least  $k$ .

Easy to see both from the fact that  $S \subseteq V$  is an independent set in  $G$  if and only if  $S$  is a clique in  $\overline{G}$ . □

# Independent Set and Clique

- 1 Independent Set  $\leq$  Clique.

# Independent Set and Clique

① **Independent Set**  $\leq$  **Clique**.

What does this mean?

② If have an algorithm for **Clique**, then we have an algorithm for **Independent Set**.

# Independent Set and Clique

① **Independent Set**  $\leq$  **Clique**.

What does this mean?

② If we have an algorithm for **Clique**, then we have an algorithm for **Independent Set**.

③ **Clique** is *at least as hard as* **Independent Set**.

# Independent Set and Clique

① **Independent Set**  $\leq$  **Clique**.

What does this mean?

② If we have an algorithm for **Clique**, then we have an algorithm for **Independent Set**.

③ **Clique** is *at least as hard as* **Independent Set**.

④ Also... **Clique**  $\leq$  **Independent Set**. Why? Thus **Clique** and **Independent Set** are polynomial-time equivalent.

# DFA Universality

A DFA  $M$  is **universal** if it accepts every string.  
That is,  $L(M) = \Sigma^*$ , the set of all strings.

# DFA Universality

A DFA  $M$  is **universal** if it accepts every string.  
That is,  $L(M) = \Sigma^*$ , the set of all strings.

## Problem (**DFA universality**)

**Input:** A DFA  $M$ .

**Goal:** *Is  $M$  universal?*

# DFA Universality

A DFA  $M$  is **universal** if it accepts every string.  
That is,  $L(M) = \Sigma^*$ , the set of all strings.

## Problem (**DFA universality**)

**Input:** A DFA  $M$ .

**Goal:** *Is  $M$  universal?*

How do we solve **DFA Universality**?

# DFA Universality

A DFA  $M$  is **universal** if it accepts every string.  
That is,  $L(M) = \Sigma^*$ , the set of all strings.

## Problem (**DFA universality**)

**Input:** A DFA  $M$ .

**Goal:** *Is  $M$  universal?*

How do we solve **DFA Universality**?

We check if  $M$  has *any* reachable non-final state.

# NFA Universality

An NFA  $N$  is said to be **universal** if it accepts every string. That is,  $L(N) = \Sigma^*$ , the set of all strings.

## Problem (NFA universality)

**Input:** A NFA  $M$ .

**Goal:** *Is  $M$  universal?*

How do we solve **NFA Universality**?

# NFA Universality

An NFA  $N$  is said to be **universal** if it accepts every string. That is,  $L(N) = \Sigma^*$ , the set of all strings.

## Problem (NFA universality)

**Input:** A NFA  $M$ .

**Goal:** Is  $M$  universal?

How do we solve **NFA Universality**?

Reduce it to **DFA Universality**?

# NFA Universality

An **NFA**  $N$  is said to be **universal** if it accepts every string. That is,  $L(N) = \Sigma^*$ , the set of all strings.

## Problem (**NFA universality**)

**Input:** A **NFA**  $M$ .

**Goal:** *Is  $M$  universal?*

How do we solve **NFA Universality**?

Reduce it to **DFA Universality**?

Given an **NFA**  $N$ , convert it to an equivalent **DFA**  $M$ , and use the **DFA Universality** Algorithm.

# NFA Universality

An **NFA**  $N$  is said to be **universal** if it accepts every string. That is,  $L(N) = \Sigma^*$ , the set of all strings.

## Problem (**NFA universality**)

**Input:** A **NFA**  $M$ .

**Goal:** *Is  $M$  universal?*

How do we solve **NFA Universality**?

Reduce it to **DFA Universality**?

Given an **NFA**  $N$ , convert it to an equivalent **DFA**  $M$ , and use the **DFA Universality** Algorithm.

The reduction takes **exponential time**!

**NFA Universality** is known to be PSPACE-Complete and we do not expect a polynomial-time algorithm.

# Polynomial-time reductions

We say that an algorithm is **efficient** if it runs in polynomial-time.

# Polynomial-time reductions

We say that an algorithm is **efficient** if it runs in polynomial-time.

To find efficient algorithms for problems, we are only interested in **polynomial-time** reductions. Reductions that take longer are not useful.

# Polynomial-time reductions

We say that an algorithm is **efficient** if it runs in polynomial-time.

To find efficient algorithms for problems, we are only interested in **polynomial-time** reductions. Reductions that take longer are not useful.

If we have a polynomial-time reduction from problem  $X$  to problem  $Y$  (we write  $X \leq_P Y$ ), and a poly-time algorithm  $\mathcal{A}_Y$  for  $Y$ , we have a polynomial-time/efficient algorithm for  $X$ .

# Polynomial-time reductions

We say that an algorithm is **efficient** if it runs in polynomial-time.

To find efficient algorithms for problems, we are only interested in **polynomial-time** reductions. Reductions that take longer are not useful.

If we have a polynomial-time reduction from problem  $X$  to problem  $Y$  (we write  $X \leq_P Y$ ), and a poly-time algorithm  $A_Y$  for  $Y$ , we have a polynomial-time/efficient algorithm for  $X$ .

# Polynomial-time Reduction

A polynomial time reduction from a *decision* problem  $X$  to a *decision* problem  $Y$  is an *algorithm*  $\mathcal{A}$  that has the following properties:

- 1 given an instance  $I_X$  of  $X$ ,  $\mathcal{A}$  produces an instance  $I_Y$  of  $Y$
- 2  $\mathcal{A}$  runs in time polynomial in  $|I_X|$ .
- 3 Answer to  $I_X$  YES *iff* answer to  $I_Y$  is YES.

## Proposition

If  $X \leq_P Y$  then a polynomial time algorithm for  $Y$  implies a polynomial time algorithm for  $X$ .

Such a reduction is called a **Karp reduction**. Most reductions we will need are Karp reductions. Karp reductions are the same as mapping reductions when specialized to polynomial time for the reduction step.

# Reductions again...

Let  $X$  and  $Y$  be two decision problems, such that  $X$  can be solved in polynomial time, and  $X \leq_P Y$ . Then

- (A)  $Y$  can be solved in polynomial time.
- (B)  $Y$  can NOT be solved in polynomial time.
- (C) If  $Y$  is hard then  $X$  is also hard.
- (D) None of the above.
- (E) All of the above.

# Polynomial-time reductions and hardness

For decision problems  $X$  and  $Y$ , if  $X \leq_P Y$ , and  $Y$  has an efficient algorithm,  $X$  has an efficient algorithm.

# Polynomial-time reductions and hardness

For decision problems  $X$  and  $Y$ , if  $X \leq_P Y$ , and  $Y$  has an efficient algorithm,  $X$  has an efficient algorithm.

If you believe that **Independent Set** does not have an efficient algorithm, why should you believe the same of **Clique**?

# Polynomial-time reductions and hardness

For decision problems  $X$  and  $Y$ , if  $X \leq_P Y$ , and  $Y$  has an efficient algorithm,  $X$  has an efficient algorithm.

If you believe that **Independent Set** does not have an efficient algorithm, why should you believe the same of **Clique**?

Because we showed **Independent Set**  $\leq_P$  **Clique**. If **Clique** had an efficient algorithm, so would **Independent Set**!

# Polynomial-time reductions and hardness

For decision problems  $X$  and  $Y$ , if  $X \leq_P Y$ , and  $Y$  has an efficient algorithm,  $X$  has an efficient algorithm.

If you believe that **Independent Set** does not have an efficient algorithm, why should you believe the same of **Clique**?

Because we showed **Independent Set**  $\leq_P$  **Clique**. If **Clique** had an efficient algorithm, so would **Independent Set**!

If  $X \leq_P Y$  and  $X$  does not have an efficient algorithm,  $Y$  cannot have an efficient algorithm!

# Polynomial-time reductions and instance sizes

## Proposition

Let  $\mathcal{R}$  be a polynomial-time reduction from  $X$  to  $Y$ . Then for any instance  $I_X$  of  $X$ , the size of the instance  $I_Y$  of  $Y$  produced from  $I_X$  by  $\mathcal{R}$  is polynomial in the size of  $I_X$ .

# Polynomial-time reductions and instance sizes

## Proposition

Let  $\mathcal{R}$  be a polynomial-time reduction from  $X$  to  $Y$ . Then for any instance  $I_X$  of  $X$ , the size of the instance  $I_Y$  of  $Y$  produced from  $I_X$  by  $\mathcal{R}$  is polynomial in the size of  $I_X$ .

## Proof.

$\mathcal{R}$  is a polynomial-time algorithm and hence on input  $I_X$  of size  $|I_X|$  it runs in time  $p(|I_X|)$  for some polynomial  $p()$ .

$I_Y$  is the output of  $\mathcal{R}$  on input  $I_X$ .

$\mathcal{R}$  can write at most  $p(|I_X|)$  bits and hence  $|I_Y| \leq p(|I_X|)$ . □

# Polynomial-time reductions and instance sizes

## Proposition

Let  $\mathcal{R}$  be a polynomial-time reduction from  $X$  to  $Y$ . Then for any instance  $I_X$  of  $X$ , the size of the instance  $I_Y$  of  $Y$  produced from  $I_X$  by  $\mathcal{R}$  is polynomial in the size of  $I_X$ .

## Proof.

$\mathcal{R}$  is a polynomial-time algorithm and hence on input  $I_X$  of size  $|I_X|$  it runs in time  $p(|I_X|)$  for some polynomial  $p()$ .

$I_Y$  is the output of  $\mathcal{R}$  on input  $I_X$ .

$\mathcal{R}$  can write at most  $p(|I_X|)$  bits and hence  $|I_Y| \leq p(|I_X|)$ . □

**Note:** Converse is not true. A reduction need not be polynomial-time even if output of reduction is of size polynomial in its input.

# Polynomial-time Reduction

A polynomial time reduction from a *decision* problem  $X$  to a *decision* problem  $Y$  is an *algorithm*  $\mathcal{A}$  that has the following properties:

- 1 Given an instance  $I_X$  of  $X$ ,  $\mathcal{A}$  produces an instance  $I_Y$  of  $Y$ .
- 2  $\mathcal{A}$  runs in time polynomial in  $|I_X|$ . This implies that  $|I_Y|$  (size of  $I_Y$ ) is polynomial in  $|I_X|$ .
- 3 Answer to  $I_X$  YES *iff* answer to  $I_Y$  is YES.

## Proposition

If  $X \leq_P Y$  then a polynomial time algorithm for  $Y$  implies a polynomial time algorithm for  $X$ .

# Transitivity of Reductions

## Proposition

$X \leq_P Y$  and  $Y \leq_P Z$  implies that  $X \leq_P Z$ .

**Note:**  $X \leq_P Y$  does not imply that  $Y \leq_P X$  and hence it is very important to know the FROM and TO in a reduction.

To prove  $X \leq_P Y$  you need to show a reduction FROM  $X$  TO  $Y$ .  
That is, show that an algorithm for  $Y$  implies an algorithm for  $X$ .

# Vertex Cover

Given a graph  $G = (V, E)$ , a set of vertices  $S$  is:

# Vertex Cover

Given a graph  $G = (V, E)$ , a set of vertices  $S$  is:

- 1 A **vertex cover** if every  $e \in E$  has at least one endpoint in  $S$ .

# Vertex Cover

Given a graph  $G = (V, E)$ , a set of vertices  $S$  is:

- 1 A **vertex cover** if every  $e \in E$  has at least one endpoint in  $S$ .

# Vertex Cover

Given a graph  $G = (V, E)$ , a set of vertices  $S$  is:

- 1 A **vertex cover** if every  $e \in E$  has at least one endpoint in  $S$ .

# Vertex Cover

Given a graph  $G = (V, E)$ , a set of vertices  $S$  is:

- 1 A **vertex cover** if every  $e \in E$  has at least one endpoint in  $S$ .

# The **Vertex Cover** Problem

## Problem (**Vertex Cover**)

**Input:** A graph  $G$  and integer  $k$ .

**Goal:** Is there a vertex cover of size  $\leq k$  in  $G$ ?

# The **Vertex Cover** Problem

## Problem (**Vertex Cover**)

**Input:** A graph  $G$  and integer  $k$ .

**Goal:** Is there a vertex cover of size  $\leq k$  in  $G$ ?

Can we relate **Independent Set** and **Vertex Cover**?

# Relationship between...

## Vertex Cover and Independent Set

### Proposition

Let  $G = (V, E)$  be a graph.  $S$  is an independent set if and only if  $V \setminus S$  is a vertex cover.

### Proof.

( $\Rightarrow$ ) Let  $S$  be an independent set

- 1 Consider any edge  $uv \in E$ .
- 2 Since  $S$  is an independent set, either  $u \notin S$  or  $v \notin S$ .
- 3 Thus, either  $u \in V \setminus S$  or  $v \in V \setminus S$ .
- 4  $V \setminus S$  is a vertex cover.

( $\Leftarrow$ ) Let  $V \setminus S$  be some vertex cover:

- 1 Consider  $u, v \in S$
- 2  $uv$  is not an edge of  $G$ , as otherwise  $V \setminus S$  does not cover  $uv$ .
- 3  $\implies S$  is thus an independent set. □

# Independent Set $\leq_P$ Vertex Cover

- 1  $G$ : graph with  $n$  vertices, and an integer  $k$  be an instance of the **Independent Set** problem.

# Independent Set $\leq_P$ Vertex Cover

- 1  $G$ : graph with  $n$  vertices, and an integer  $k$  be an instance of the **Independent Set** problem.
- 2  $G$  has an independent set of size  $\geq k$  iff  $G$  has a vertex cover of size  $\leq n - k$

# Independent Set $\leq_P$ Vertex Cover

- 1  $G$ : graph with  $n$  vertices, and an integer  $k$  be an instance of the **Independent Set** problem.
- 2  $G$  has an independent set of size  $\geq k$  iff  $G$  has a vertex cover of size  $\leq n - k$
- 3  $(G, k)$  is an instance of **Independent Set** , and  $(G, n - k)$  is an instance of **Vertex Cover** with the same answer.

# Independent Set $\leq_P$ Vertex Cover

- 1  $G$ : graph with  $n$  vertices, and an integer  $k$  be an instance of the **Independent Set** problem.
- 2  $G$  has an independent set of size  $\geq k$  iff  $G$  has a vertex cover of size  $\leq n - k$
- 3  $(G, k)$  is an instance of **Independent Set**, and  $(G, n - k)$  is an instance of **Vertex Cover** with the same answer.
- 4 Therefore, **Independent Set**  $\leq_P$  **Vertex Cover**. Also **Vertex Cover**  $\leq_P$  **Independent Set**.

# Proving Correctness of Reductions

To prove that  $X \leq_P Y$  you need to give an algorithm  $\mathcal{A}$  that:

- 1 Transforms an instance  $I_X$  of  $X$  into an instance  $I_Y$  of  $Y$ .
- 2 Satisfies the property that answer to  $I_X$  is YES iff  $I_Y$  is YES.
  - 1 typical easy direction to prove: answer to  $I_Y$  is YES if answer to  $I_X$  is YES
  - 2 **typical difficult direction to prove**: answer to  $I_X$  is YES if answer to  $I_Y$  is YES (equivalently answer to  $I_X$  is NO if answer to  $I_Y$  is NO).
- 3 Runs in **polynomial** time.

## Part III

# The Satisfiability Problem (SAT)

# Propositional Formulas

## Definition

Consider a set of boolean variables  $x_1, x_2, \dots, x_n$ .

- 1 A **literal** is either a boolean variable  $x_j$  or its negation  $\neg x_j$ .
- 2 A **clause** is a disjunction of literals.  
For example,  $x_1 \vee x_2 \vee \neg x_4$  is a clause.
- 3 A **formula in conjunctive normal form (CNF)** is propositional formula which is a conjunction of clauses
  - 1  $(x_1 \vee x_2 \vee \neg x_4) \wedge (x_2 \vee \neg x_3) \wedge x_5$  is a **CNF** formula.

# Propositional Formulas

## Definition

Consider a set of boolean variables  $x_1, x_2, \dots, x_n$ .

- 1 A **literal** is either a boolean variable  $x_j$  or its negation  $\neg x_j$ .
- 2 A **clause** is a disjunction of literals.  
For example,  $x_1 \vee x_2 \vee \neg x_4$  is a clause.
- 3 A **formula in conjunctive normal form (CNF)** is propositional formula which is a conjunction of clauses
  - 1  $(x_1 \vee x_2 \vee \neg x_4) \wedge (x_2 \vee \neg x_3) \wedge x_5$  is a **CNF** formula.
- 4 A formula  $\varphi$  is a **3CNF**:  
A **CNF** formula such that every clause has **exactly** 3 literals.
  - 1  $(x_1 \vee x_2 \vee \neg x_4) \wedge (x_2 \vee \neg x_3 \vee x_1)$  is a **3CNF** formula, but  $(x_1 \vee x_2 \vee \neg x_4) \wedge (x_2 \vee \neg x_3) \wedge x_5$  is not.

## Problem: SAT

**Instance:** A CNF formula  $\varphi$ .

**Question:** Is there a truth assignment to the variables of  $\varphi$  such that  $\varphi$  evaluates to true?

## Problem: 3SAT

**Instance:** A 3CNF formula  $\varphi$ .

**Question:** Is there a truth assignment to the variables of  $\varphi$  such that  $\varphi$  evaluates to true?

# Satisfiability

## SAT

Given a **CNF** formula  $\varphi$ , is there a truth assignment to variables such that  $\varphi$  evaluates to true?

## Example

- 1  $(x_1 \vee x_2 \vee \neg x_4) \wedge (x_2 \vee \neg x_3) \wedge x_5$  is satisfiable; take  $x_1, x_2, \dots, x_5$  to be all true
- 2  $(x_1 \vee \neg x_2) \wedge (\neg x_1 \vee x_2) \wedge (\neg x_1 \vee \neg x_2) \wedge (x_1 \vee x_2)$  is not satisfiable.

## 3SAT

Given a **3CNF** formula  $\varphi$ , is there a truth assignment to variables such that  $\varphi$  evaluates to true?

(More on **2SAT** in a bit...)

# Importance of **SAT** and **3SAT**

- ① **SAT** and **3SAT** are basic constraint satisfaction problems.
- ② Many different problems can be reduced to them because of the simple yet powerful expressiveness of logical constraints.
- ③ Arise naturally in many applications involving hardware and software verification and correctness.
- ④ As we will see, it is a fundamental problem in theory of **NP-Completeness**.

$$z = \bar{x}$$

Given two bits  $x, z$  which of the following **SAT** formulas is equivalent to the formula  $z = \bar{x}$ :

(A)  $(\bar{z} \vee x) \wedge (z \vee \bar{x})$ .

(B)  $(z \vee x) \wedge (\bar{z} \vee \bar{x})$ .

(C)  $(\bar{z} \vee x) \wedge (\bar{z} \vee \bar{x}) \wedge (\bar{z} \vee \bar{x})$ .

(D)  $z \oplus x$ .

(E)  $(z \vee x) \wedge (\bar{z} \vee \bar{x}) \wedge (z \vee \bar{x}) \wedge (\bar{z} \vee x)$ .

$$z = x \wedge y$$

Given three bits  $x, y, z$  which of the following **SAT** formulas is equivalent to the formula  $z = x \wedge y$ :

- (A)  $(\bar{z} \vee x \vee y) \wedge (z \vee \bar{x} \vee \bar{y})$ .
- (B)  $(\bar{z} \vee x \vee y) \wedge (\bar{z} \vee \bar{x} \vee y) \wedge (z \vee \bar{x} \vee \bar{y})$ .
- (C)  $(\bar{z} \vee x \vee y) \wedge (\bar{z} \vee \bar{x} \vee y) \wedge (z \vee \bar{x} \vee y) \wedge (z \vee \bar{x} \vee \bar{y})$ .
- (D)  $(z \vee x \vee y) \wedge (\bar{z} \vee \bar{x} \vee y) \wedge (z \vee \bar{x} \vee y) \wedge (z \vee \bar{x} \vee \bar{y})$ .
- (E)  $(z \vee x \vee y) \wedge (z \vee x \vee \bar{y}) \wedge (z \vee \bar{x} \vee y) \wedge (z \vee \bar{x} \vee \bar{y}) \wedge$   
 $(\bar{z} \vee x \vee y) \wedge (\bar{z} \vee x \vee \bar{y}) \wedge (\bar{z} \vee \bar{x} \vee y) \wedge (\bar{z} \vee \bar{x} \vee \bar{y})$ .

②  $(z \vee \bar{x} \vee y) \wedge (z \vee \bar{x} \vee \bar{y}) = z \vee \bar{x}$

② Using the above two observations, we have the following.

## Lemma

The formula  $z = x \vee y$  is equivalent to the **CNF** formula

$$(z = x \vee y) \equiv (z \vee \bar{y}) \wedge (z \vee \bar{x}) \wedge (\bar{z} \vee x \vee y)$$

# SAT $\leq_p$ 3SAT

How **SAT** is different from **3SAT**?

In **SAT** clauses might have arbitrary length: **1, 2, 3, ...** variables:

$$(x \vee y \vee z \vee w \vee u) \wedge (\neg x \vee \neg y \vee \neg z \vee w \vee u) \wedge (\neg x)$$

In **3SAT** every clause must have **exactly 3** different literals.

# SAT $\leq_p$ 3SAT

## How SAT is different from 3SAT?

In SAT clauses might have arbitrary length: 1, 2, 3, ... variables:

$$(x \vee y \vee z \vee w \vee u) \wedge (\neg x \vee \neg y \vee \neg z \vee w \vee u) \wedge (\neg x)$$

In 3SAT every clause must have **exactly 3** different literals.

To reduce from an instance of SAT to an instance of 3SAT, we must make all clauses to have exactly 3 variables...

## Basic idea

- 1 Pad short clauses so they have 3 literals.
- 2 Break long clauses into shorter clauses.
- 3 Repeat the above till we have a 3CNF.

# 3SAT $\leq_P$ SAT

① 3SAT  $\leq_P$  SAT.

② Because...

A 3SAT instance is also an instance of SAT.

# $SAT \leq_p 3SAT$

Claim

$SAT \leq_p 3SAT$ .

# SAT $\leq_P$ 3SAT

## Claim

SAT  $\leq_P$  3SAT.

Given  $\varphi$  a SAT formula we create a 3SAT formula  $\varphi'$  such that

- 1  $\varphi$  is satisfiable iff  $\varphi'$  is satisfiable.
- 2  $\varphi'$  can be constructed from  $\varphi$  in time polynomial in  $|\varphi|$ .

# SAT $\leq_P$ 3SAT

## Claim

SAT  $\leq_P$  3SAT.

Given  $\varphi$  a SAT formula we create a 3SAT formula  $\varphi'$  such that

- 1  $\varphi$  is satisfiable iff  $\varphi'$  is satisfiable.
- 2  $\varphi'$  can be constructed from  $\varphi$  in time polynomial in  $|\varphi|$ .

**Idea:** if a clause of  $\varphi$  is not of length 3, replace it with several clauses of length exactly 3.

# SAT $\leq_p$ 3SAT

A clause with two literals

## Reduction Ideas: clause with 2 literals

- 1 **Case clause with 2 literals:** Let  $c = l_1 \vee l_2$ . Let  $u$  be a new variable. Consider

$$c' = (l_1 \vee l_2 \vee u) \wedge (l_1 \vee l_2 \vee \neg u).$$

- 2 Suppose  $\varphi = \psi \wedge c$ . Then  $\varphi' = \psi \wedge c'$  is satisfiable iff  $\varphi$  is satisfiable.

# SAT $\leq_p$ 3SAT

A clause with a single literal

## Reduction Ideas: clause with 1 literal

- 1 **Case clause with one literal:** Let  $c$  be a clause with a single literal (i.e.,  $c = \ell$ ). Let  $u, v$  be new variables. Consider

$$c' = (\ell \vee u \vee v) \wedge (\ell \vee u \vee \neg v) \\ \wedge (\ell \vee \neg u \vee v) \wedge (\ell \vee \neg u \vee \neg v).$$

- 2 Suppose  $\varphi = \psi \wedge c$ . Then  $\varphi' = \psi \wedge c'$  is satisfiable iff  $\varphi$  is satisfiable.

# SAT $\leq_p$ 3SAT

A clause with more than 3 literals

## Reduction Ideas: clause with more than 3 literals

- 1 **Case clause with five literals:** Let  $c = l_1 \vee l_2 \vee l_3 \vee l_4 \vee l_5$ . Let  $u$  be a new variable. Consider

$$c' = (l_1 \vee l_2 \vee l_3 \vee u) \wedge (l_4 \vee l_5 \vee \neg u).$$

- 2 Suppose  $\varphi = \psi \wedge c$ . Then  $\varphi' = \psi \wedge c'$  is satisfiable iff  $\varphi$  is satisfiable.

# SAT $\leq_p$ 3SAT

A clause with more than 3 literals

## Reduction Ideas: clause with more than 3 literals

- 1 **Case clause with  $k > 3$  literals:** Let  $c = l_1 \vee l_2 \vee \dots \vee l_k$ .  
Let  $u$  be a new variable. Consider

$$c' = (l_1 \vee l_2 \dots l_{k-2} \vee u) \wedge (l_{k-1} \vee l_k \vee \neg u).$$

- 2 Suppose  $\varphi = \psi \wedge c$ . Then  $\varphi' = \psi \wedge c'$  is satisfiable iff  $\varphi$  is satisfiable.

# Breaking a clause

## Lemma

For any boolean formulas  $X$  and  $Y$  and  $z$  a new boolean variable.  
Then

$X \vee Y$  is satisfiable

if and only if,  $z$  can be assigned a value such that

$(X \vee z) \wedge (Y \vee \neg z)$  is satisfiable

(with the same assignment to the variables appearing in  $X$  and  $Y$ ).

# $SAT \leq_p 3SAT$ (contd)

Clauses with more than 3 literals

Let  $c = \ell_1 \vee \dots \vee \ell_k$ . Let  $u_1, \dots, u_{k-3}$  be new variables. Consider

$$\begin{aligned} c' = & (\ell_1 \vee \ell_2 \vee u_1) \wedge (\ell_3 \vee \neg u_1 \vee u_2) \\ & \wedge (\ell_4 \vee \neg u_2 \vee u_3) \wedge \\ & \dots \wedge (\ell_{k-2} \vee \neg u_{k-4} \vee u_{k-3}) \wedge (\ell_{k-1} \vee \ell_k \vee \neg u_{k-3}). \end{aligned}$$

## Claim

$\varphi = \psi \wedge c$  is satisfiable iff  $\varphi' = \psi \wedge c'$  is satisfiable.

Another way to see it — reduce size of clause by one:

$$c' = (\ell_1 \vee \ell_2 \dots \vee \ell_{k-2} \vee u_{k-3}) \wedge (\ell_{k-1} \vee \ell_k \vee \neg u_{k-3}).$$

# An Example

## Example

$$\begin{aligned}\varphi = & \left( \neg x_1 \vee \neg x_4 \right) \wedge \left( x_1 \vee \neg x_2 \vee \neg x_3 \right) \\ & \wedge \left( \neg x_2 \vee \neg x_3 \vee x_4 \vee x_1 \right) \wedge \left( x_1 \right).\end{aligned}$$

Equivalent form:

$$\psi = \left( \neg x_1 \vee \neg x_4 \vee z \right) \wedge \left( \neg x_1 \vee \neg x_4 \vee \neg z \right)$$

# An Example

## Example

$$\begin{aligned}\varphi = & (\neg x_1 \vee \neg x_4) \wedge (x_1 \vee \neg x_2 \vee \neg x_3) \\ & \wedge (\neg x_2 \vee \neg x_3 \vee x_4 \vee x_1) \wedge (x_1).\end{aligned}$$

Equivalent form:

$$\begin{aligned}\psi = & (\neg x_1 \vee \neg x_4 \vee z) \wedge (\neg x_1 \vee \neg x_4 \vee \neg z) \\ & \wedge (x_1 \vee \neg x_2 \vee \neg x_3)\end{aligned}$$

# An Example

## Example

$$\begin{aligned}\varphi = & \left( \neg x_1 \vee \neg x_4 \right) \wedge \left( x_1 \vee \neg x_2 \vee \neg x_3 \right) \\ & \wedge \left( \neg x_2 \vee \neg x_3 \vee x_4 \vee x_1 \right) \wedge \left( x_1 \right).\end{aligned}$$

Equivalent form:

$$\begin{aligned}\psi = & \left( \neg x_1 \vee \neg x_4 \vee z \right) \wedge \left( \neg x_1 \vee \neg x_4 \vee \neg z \right) \\ & \wedge \left( x_1 \vee \neg x_2 \vee \neg x_3 \right) \\ & \wedge \left( \neg x_2 \vee \neg x_3 \vee y_1 \right) \wedge \left( x_4 \vee x_1 \vee \neg y_1 \right)\end{aligned}$$

# An Example

## Example

$$\begin{aligned}\varphi = & \left( \neg x_1 \vee \neg x_4 \right) \wedge \left( x_1 \vee \neg x_2 \vee \neg x_3 \right) \\ & \wedge \left( \neg x_2 \vee \neg x_3 \vee x_4 \vee x_1 \right) \wedge \left( x_1 \right).\end{aligned}$$

Equivalent form:

$$\begin{aligned}\psi = & \left( \neg x_1 \vee \neg x_4 \vee z \right) \wedge \left( \neg x_1 \vee \neg x_4 \vee \neg z \right) \\ & \wedge \left( x_1 \vee \neg x_2 \vee \neg x_3 \right) \\ & \wedge \left( \neg x_2 \vee \neg x_3 \vee y_1 \right) \wedge \left( x_4 \vee x_1 \vee \neg y_1 \right) \\ & \wedge \left( x_1 \vee u \vee v \right) \wedge \left( x_1 \vee u \vee \neg v \right) \\ & \wedge \left( x_1 \vee \neg u \vee v \right) \wedge \left( x_1 \vee \neg u \vee \neg v \right).\end{aligned}$$

# Overall Reduction Algorithm

Reduction from **SAT** to **3SAT**

```
ReduceSATto3SAT( $\varphi$ ):
```

```
  //  $\varphi$ : CNF formula.
```

```
  for each clause  $c$  of  $\varphi$  do
```

```
    if  $c$  does not have exactly 3 literals then  
      construct  $c'$  as before
```

```
    else
```

```
       $c' = c$ 
```

```
   $\psi$  is conjunction of all  $c'$  constructed in loop
```

```
  return Solver3SAT( $\psi$ )
```

## Correctness (informal)

$\varphi$  is satisfiable iff  $\psi$  is satisfiable because for each clause  $c$ , the new 3CNF formula  $c'$  is logically equivalent to  $c$ .

# What about **2SAT**?

**2SAT** can be solved in polynomial time! (specifically, linear time!)

No known polynomial time reduction from **SAT** (or **3SAT**) to **2SAT**. If there was, then **SAT** and **3SAT** would be solvable in polynomial time.

## Why the reduction from **3SAT** to **2SAT** fails?

Consider a clause  $(x \vee y \vee z)$ . We need to reduce it to a collection of **2CNF** clauses. Introduce a fresh variable  $\alpha$ , and rewrite this as

$$\begin{array}{ll} (x \vee y \vee \alpha) \wedge (\neg \alpha \vee z) & \text{(bad! clause with 3 vars)} \\ \text{or } (x \vee \alpha) \wedge (\neg \alpha \vee y \vee z) & \text{(bad! clause with 3 vars).} \end{array}$$

(In animal farm language: **2SAT** good, **3SAT** bad.)

# What about **2SAT**?

A challenging exercise: Given a **2SAT** formula show to compute its satisfying assignment...

(Hint: Create a graph with two vertices for each variable (for a variable  $x$  there would be two vertices with labels  $x = 0$  and  $x = 1$ ). For every **2CNF** clause add two directed edges in the graph. The edges are implication edges: They state that if you decide to assign a certain value to a variable, then you must assign a certain value to some other variable.

Now compute the strong connected components in this graph, and continue from there...)
