ECE 220

Lecture 1

Slides based on material by: Yuting Chen, Yih-Chun Hu & Ujjal Bhowmik

Course logistics - 1

- Lectures: Tuesdays & Thursday
 - Different sections offered by different instructors
 - Feel free to attend any; up to capacity limits.
- Labs: Fridays
 - Starts on the hour, typically every hour from morning till close.
- Office hours: Schedule TBD, will be posted to website.

Course logistics - 2

- [Course Website](#) (and syllabus)
- **Grading:** Gradescope + autograder
- **Discussions:** EdStem
- **Quizzes:** CBTF
- **Machine problems (MPs):** Github
- **Textbook:** Patt & Patel (3rd Ed)

Coverpages of two different editions of the textbook.

Course logistics - 3

- **MPs:** 12 in total, lowest dropped (except MP 12)
- **Quizzes** (in-person in CBTF): 6 total, lowest dropped
- **Exams** (in-person, on-paper): two midterm and a final exam
- **Labs:** make up points lost on MPs

Group	Weight
Labs	0%
Machine Problems	15%
Midterms	40%
Final Exam	25%
Quizzes	20%
Total	100%

Syllabus review

Quick recap of ECE 120

Lesson objectives

- Recall Von Neumann model of computation
- Recall LC3 basics
 - Number of GPRs, types of commands, addressing, etc.
 - Write a small LC3 program
- Understand memory mapped I/O
 - Handshaking procedures
 - Implementation using LC3

Computation

Von Neumann model

- Five major components:

- 1.
- 2.
- 3.
- 4.
- 5.

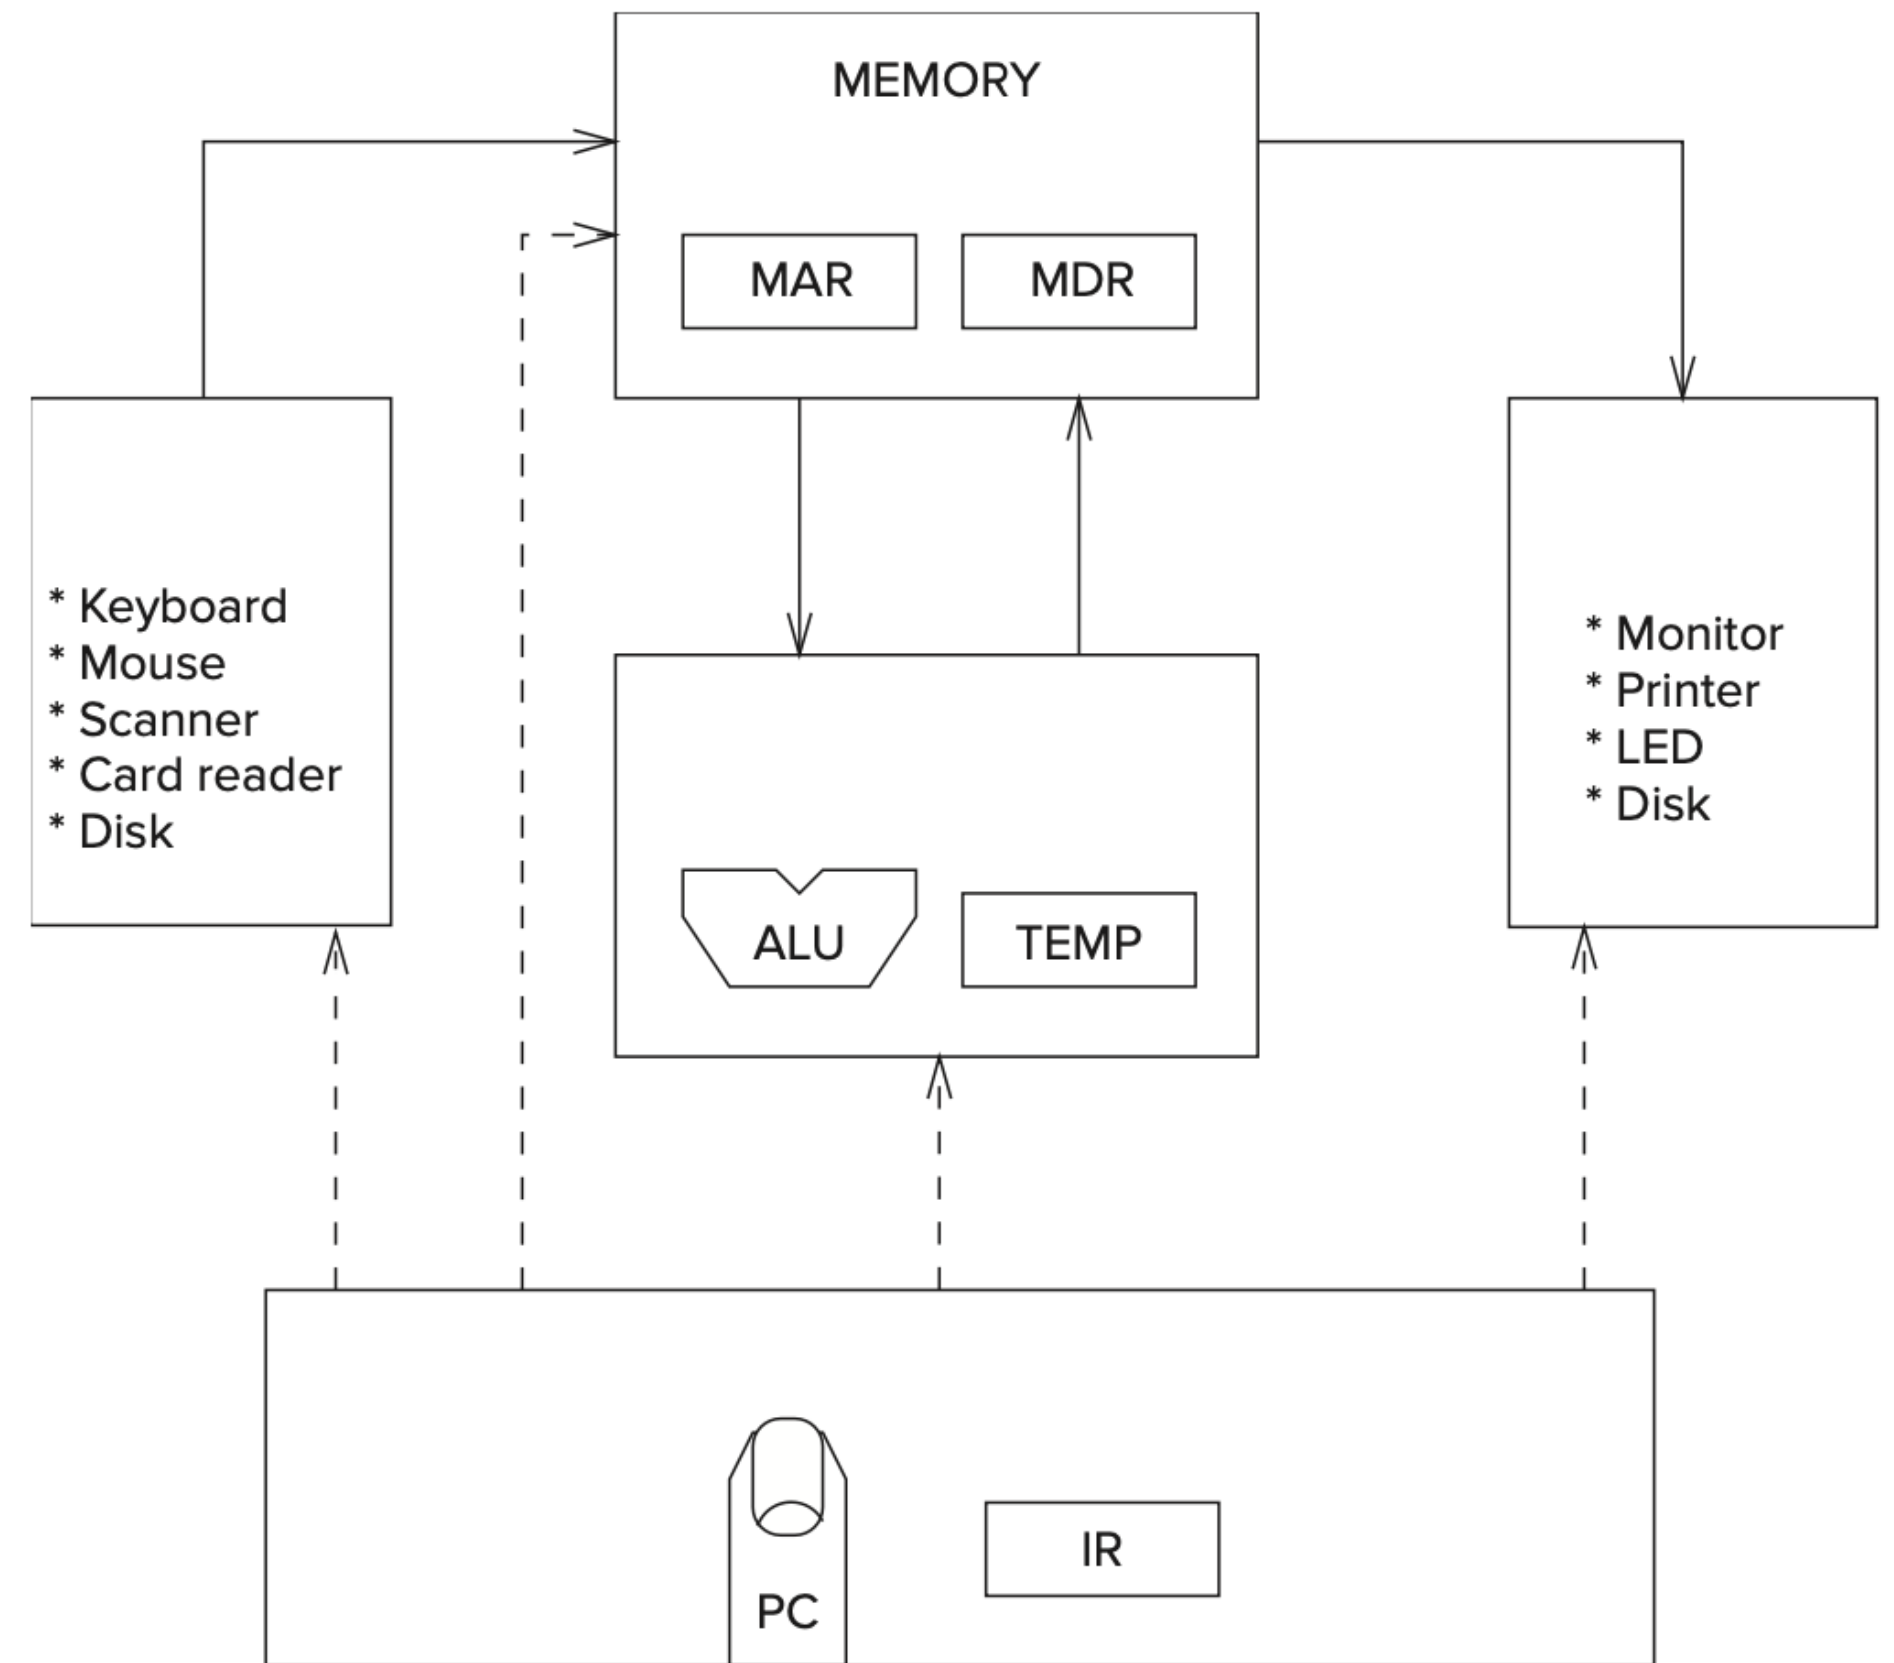

Figure 4.1 - P&P 3rd Ed.

LC3 Review 1

- Eight GPRs - denoted _____.
- Data type: 16-bit 2's complement integers
- Addressing: Locations _____ contain 16 bits each.
- Addressing modes:
 - Immediate, register relative, PC-relative, base + offset, indirect

LC3 Review 2

Addressing modes

- **PC relative**, the address is calculated by adding an offset to the incremented program counter, PC.
- **Register relative**, address is read from a register.
- **Indirect**, address is read *from* a memory location whose address is calculated by adding an offset to the incremented program counter.
- **Load effective address (LEA)**, address is calculated by adding an offset to the incremented program counter. The address itself (not its value) is stored in a register.

LC3 Review 3

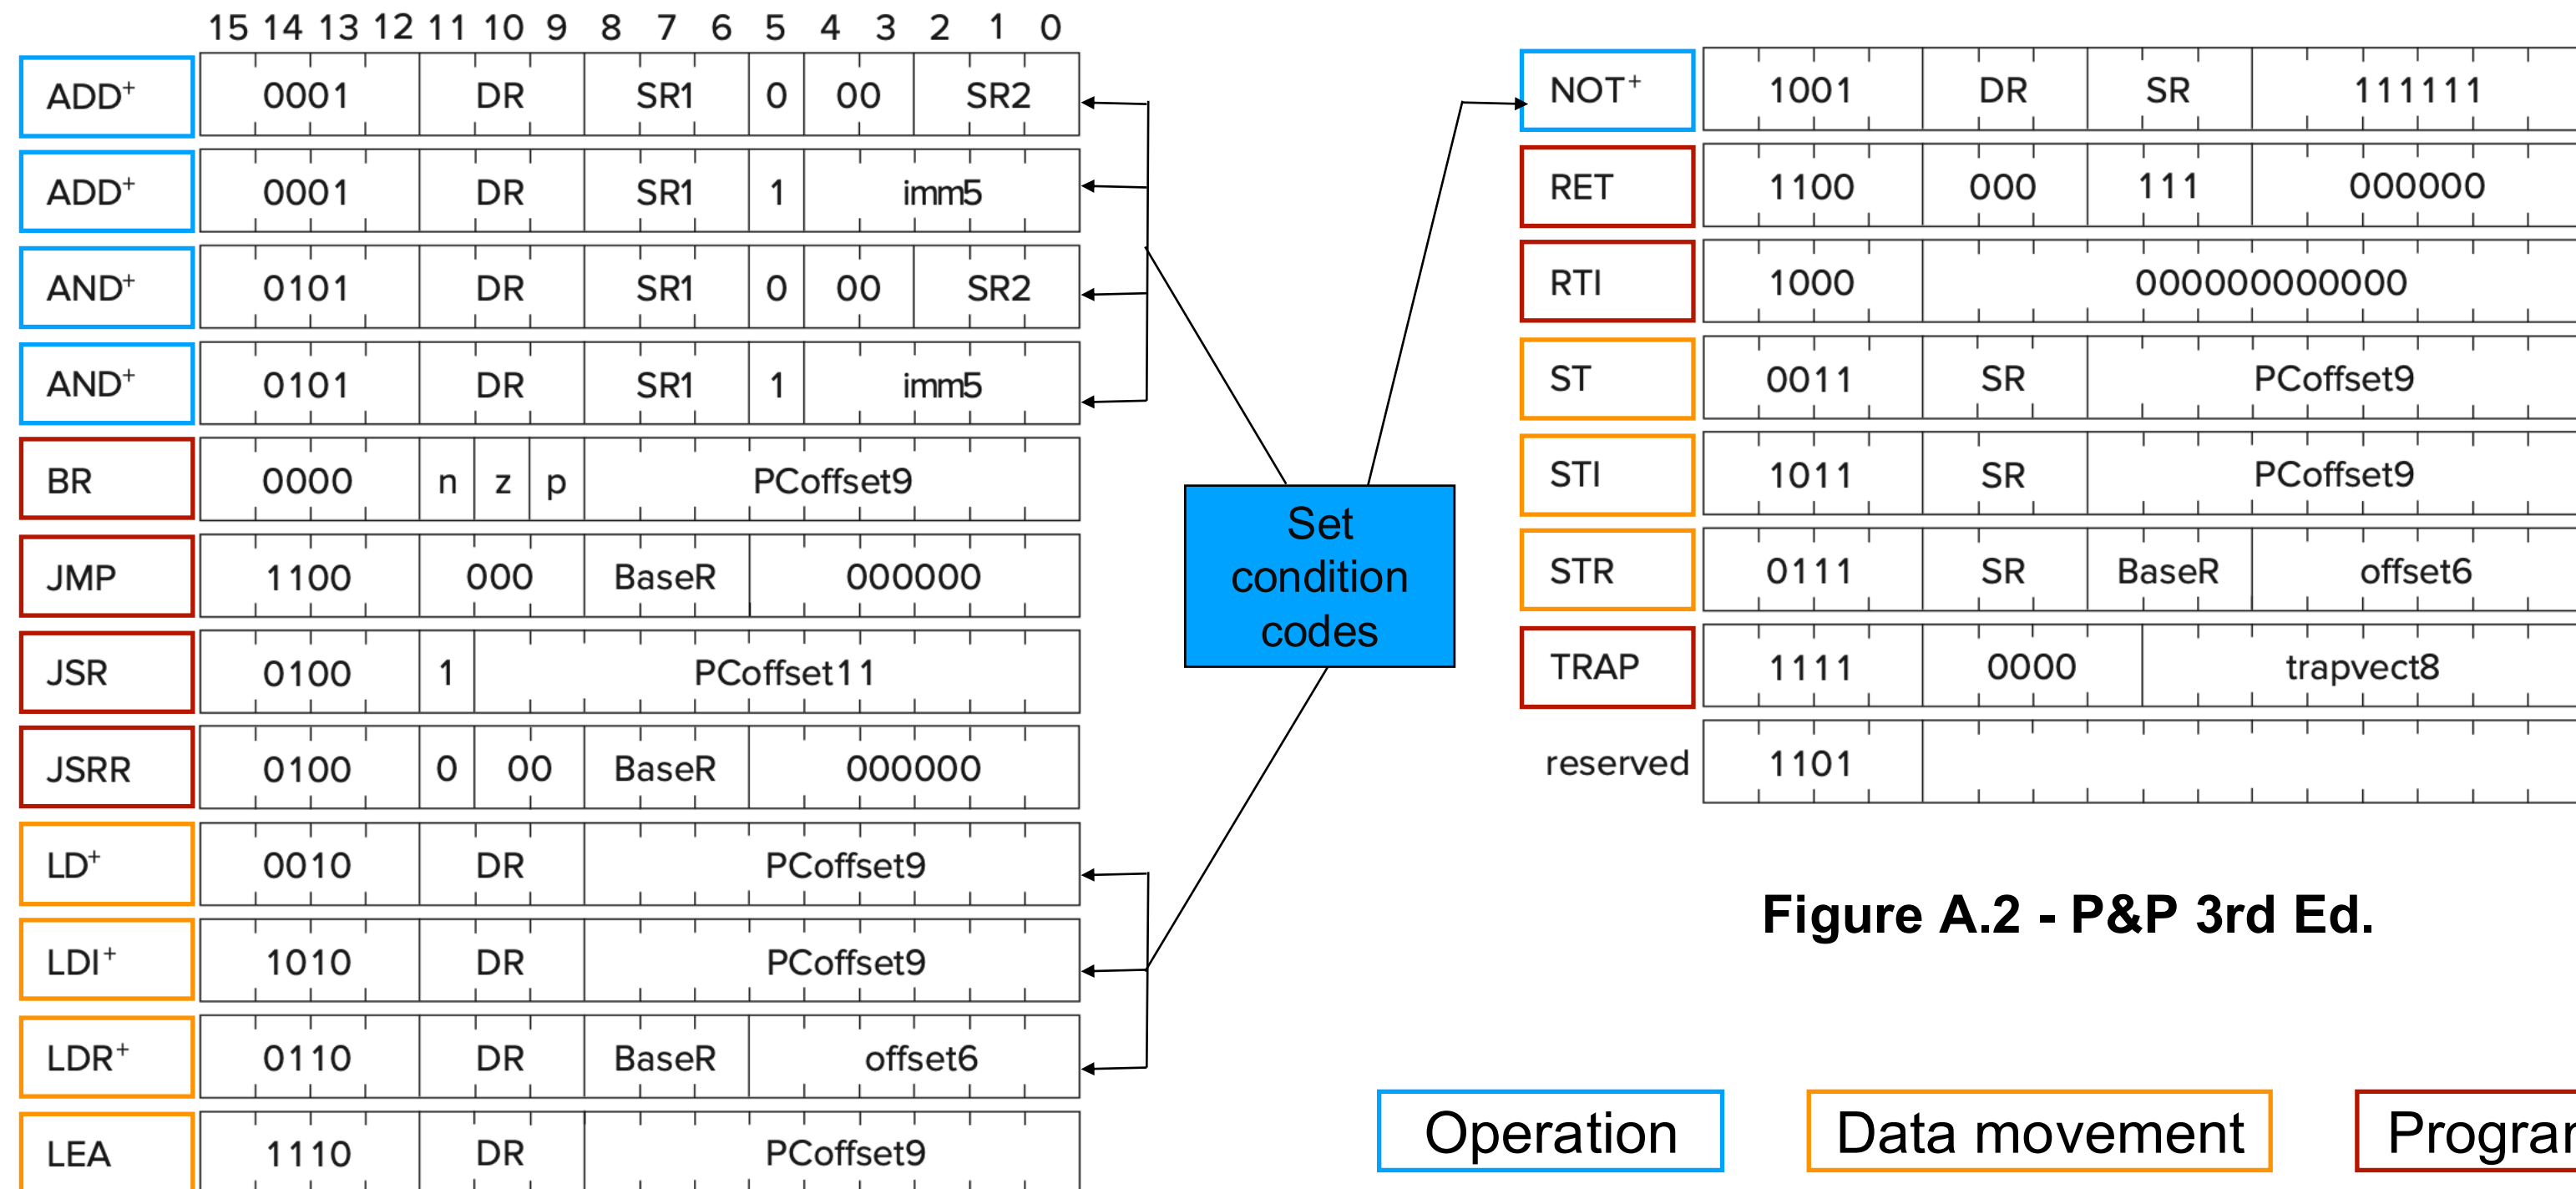

Addressing modes

Sign-extend (SX), by replicating the most significant bit as many times as necessary to extend to the word size of 16 bits.

Opcode	Name	Assembly	Operation
LD	Load	LD DR, label	$dr = \text{mem}[\text{pc} + \text{SX}(\text{offset9})]$
LDR	Load Register	LDR DR, BaseR, offset6	$dr = \text{mem}[\text{baseR} + \text{SX}(\text{offset6})]$
LDI	Load Indirect	LDI DR, label	$dr = \text{mem}[\text{mem}[\text{pc} + \text{SX}(\text{offset9})]]$
LEA	Load Eff. Addr.	LEA DR, target	$dr = \text{pc} + \text{SX}(\text{offset9})$
ST	Store	ST SR, label	$\text{mem}[\text{pc} + \text{SX}(\text{offset9})] = sr$
STR	Store Register	STR SR, BaseR, offset6	$\text{mem}[\text{baseR} + \text{SX}(\text{offset6})] = sr$
STI	Store Indirect	STI SR, label	$\text{mem}[\text{mem}[\text{pc} + \text{SX}(\text{offset9})]] = sr$

LC3 Review 4

Instruction set

Exercise 0

```
.ORIG x3000
LD  R1, LABEL
LDI R2, LABEL
LDR R3, R2, #1
LEA R4, LABEL
LABEL .FILL x4001
.END
```

What are the values of R1, R2, R3 & R4 at each step?

Assume

```
; x4001 x6001
; .....
; x6001 x7001
; x6002 x7002
```

Exercise 1

- Write a program to perform the multiplication 5×4 .
 - Need a way to store 5 and 4 as arguments
 - There is no multiplication operation
 - So have to repeat addition

```
.ORIG x3000
; R0 - output, init to 0
; R1 - multiplicand 1, init to 5
; R2 - loop counter, init to multiplicand 2
```

LC3 - Review

Pseudo-ops

- Looks like instruction but the “opcode” starts with a dot.
- Assembler instructions/directives that make our lives easier.

<i>Opcode</i>	<i>Operand</i>	<i>Meaning</i>
.ORIG	address	Starting address of program
.END		End of program
.BLKW	n	Allocate n words of storage
.STRINGZ	n-character string	Allocate n+1 locations, initialize with characters and null terminator

Textbook v2 vs. v3

- What is different in v3 compared to v2?
 - `LEA` no longer sets condition codes
 - `TRAP` instructions do not store linkage in `R7`
- What does that mean for you?
 - Do MPS on EWS machines!
 - Practice for the quiz on the online simulator:
<https://courses.grainger.illinois.edu/ece220/sp2020/lc3web/index.html>

This probably doesn't mean much to you right now ...

Memory mapped I/O

- How do we communicate with the computer?
- **Memory-mapped I/O:** Hardware devices (i.e. their registers) are *treated* the same as the computer's main memory and addressable the same way
 - Memory of *peripherals is physically separate* from main memory
- Alternative: [Port mapped I/O](#) (older paradigm, requires having more specialized instructions)
- In LC3: `KBDR`, `KBSR`, `DSR`, `DDR` are used for [K]eyboard and [D]isplay respectively.

LC3 – I/O Device Registers

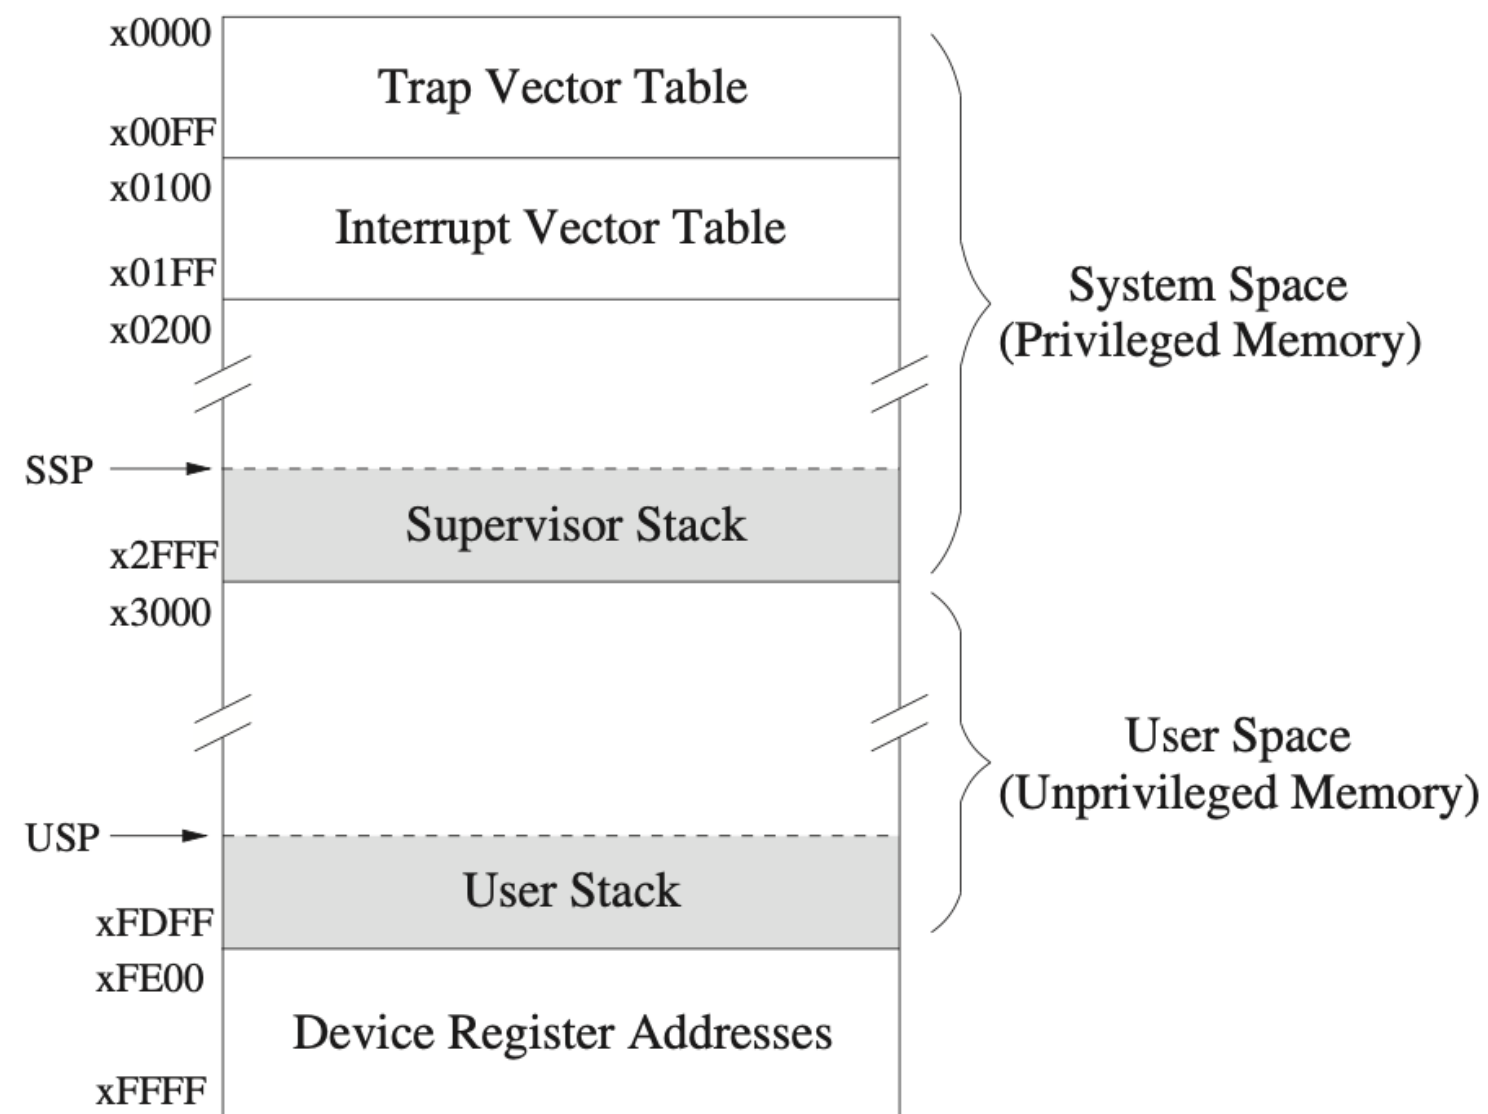

Figure A.1 - P&P 3rd Ed.

Address	I/O Register Name	I/O Register Function
xFE00	Keyboard status register (KBSR)	The ready bit (bit[15]) indicates if the keyboard has received a new character
xFE02	Keyboard data register (KBDR)	Bits [7:0] contain the last character typed on the keyboard
xFE04	Display status register (DSR)	The ready bit (bit[15]) indicates if the display device is ready to receive another character to print on the screen
xFE06	Display data register (DDR)	A character written in bits [7:0] will be displayed on the screen

LC3 - Input/Output (IO)

Address	I/O Register Name	I/O Register Function
xFE00	Keyboard status register (KBSR)	The ready bit (bit[15]) indicates if the keyboard has received a new character
xFE02	Keyboard data register (KBDR)	Bits [7:0] contain the last character typed on the keyboard
xFE04	Display status register (DSR)	The ready bit (bit[15]) indicates if the display device is ready to receive another character to print on the screen
xFE06	Display data register (DDR)	A character written in bits [7:0] will be displayed on the screen

LC3 – Keyboard Handshaking

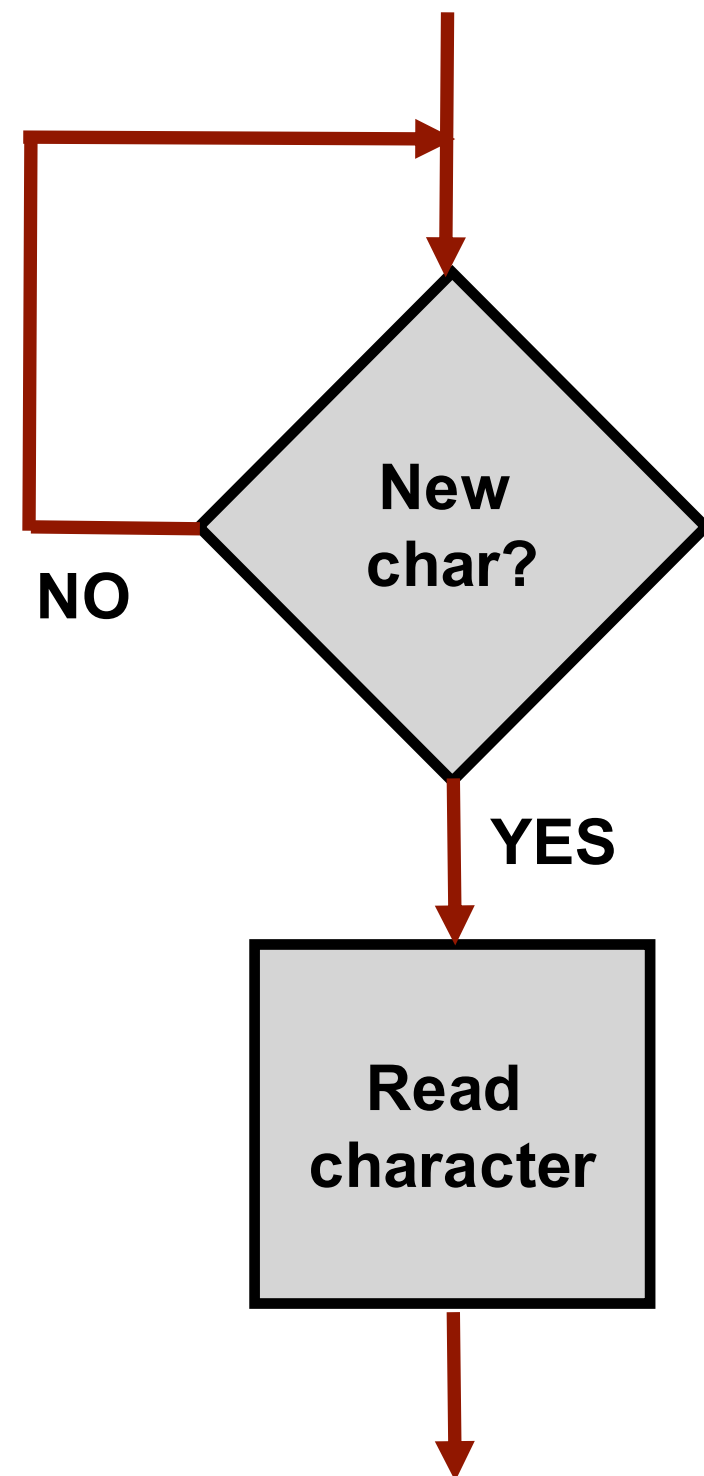

Basic routine

Handshaking is performed using `KBSR` & `KBDR`

- When user presses a key
 - Its ASCII code is placed in `KBDR[0:7]`
 - `KBSR[15]` is set to 1 (*ready bit*)
 - Keyboard is disabled, i.e., any further keypress is ignored
- When `KBDR` is read by CPU
 - `KBSR[15]` is set to 0
 - Keyboard is enabled

LC3 - Input from keyboard

Basic routine

```
.ORIG x3000
;Create a loop to
check KBSR

;If ready bit unset
loop again

;If ready bit set,
read KBDR into R0

KBSR .FILL xFE00
KBDR .FILL xFE02
```

```
.ORIG x3000
K POLL LDI R1, KBSR
      BRzp K POLL
      LDI R0, KBDR
;...
;...
HALT

KBSR .FILL xFE04
KBDR .FILL xFE06
.END
```

LC3 - Display handshaking

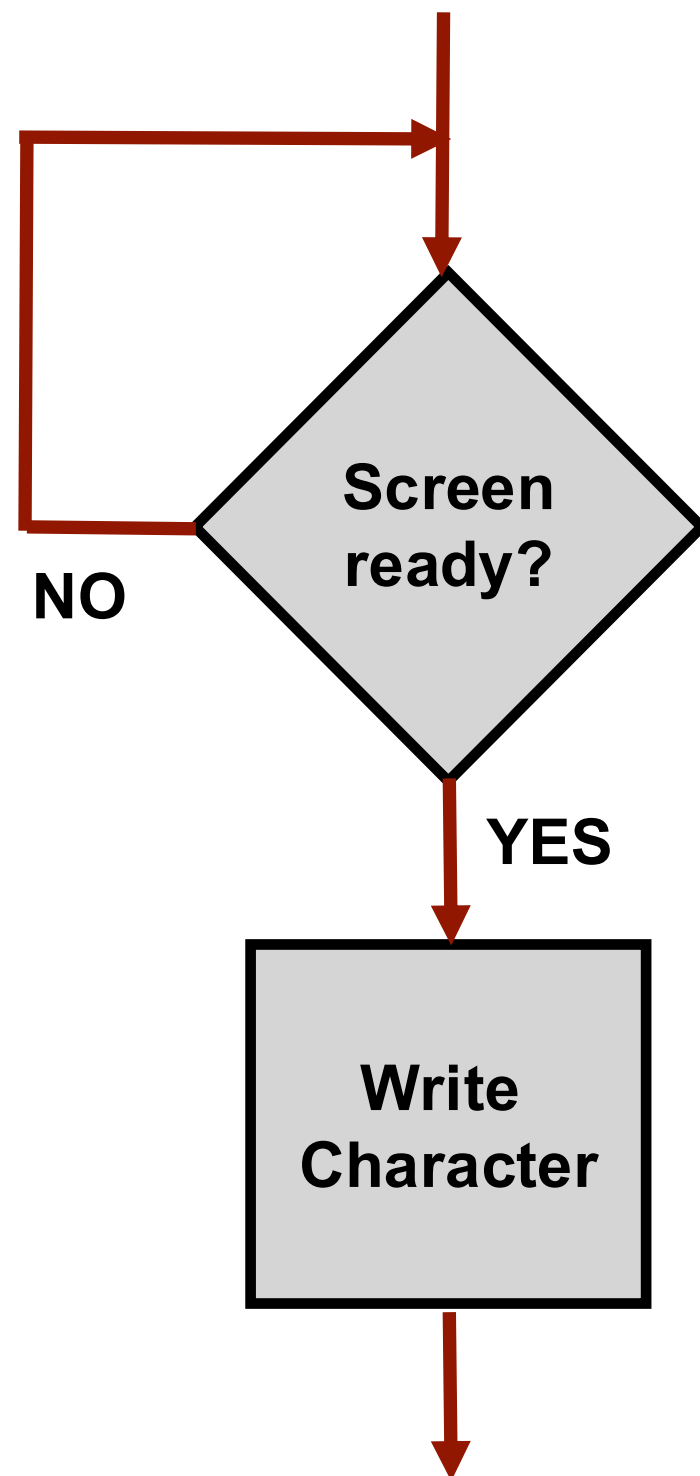

Basic routine

Handshaking is performed using `DSR` & `DDR`

- When display is ready to present a character
 - `DSR[15]` is set to 1 (*ready bit*)
- When a new character is written to `DDR`
 - `DSR[15]` is set to 0
 - Any other chars written to `DDR` are ignored
 - `DDR[7:0]` is displayed

LC3 - Display to console

Basic routine

```
.ORIG x3000
;Create a loop to
check DSR

;If ready bit unset
loop again

;If ready bit set,
write R0 into DDR

DSR .FILL xFE04
DDR .FILL xFE06
```

```
.ORIG x3000
DPOLL LDI R1, DSR
      BRzp DPOLL
      STI R0, DDR
;...
;...
HALT

DSR .FILL xFE00
DDR .FILL xFE02
.END
```

Exercise 2

- Write a program to display “ECE 220 is fun!” to the console. You can use the pseudo-op `.STRINGZ` to store string to memory. Do not use `TRAP` codes (*if you know what they are*).

Issues with polling?

- Consider “echo” routine:

```
KPOLL  LDI    R1, KBSR
        BRzp  KPOLL
        LDI    R0, KBDR
```

```
DPOLL  LDI    R1, DSR
        BRzp  DPOLL
        STI    R0, DDR
```

```
        BRnzp NEXT_TASK
KBSR    .FILL  xFE00
KBDR    .FILL  xFE02
DSR     .FILL  xFE04
DDR     .FILL  xFE06
```

- Reading & writing from keyboard or display is common task
 - Inefficient to keep repeating this code
 - Need to free up R1 and R0 for use whenever blocks run
 - Save/restore current values before/after these blocks run

Recap from last time

- Consider “echo” routine:

```
;SAVE R0, R1
K POLL  LDI    R1, KBSR
        BRz p  K POLL
        LDI    R0, KBDR
;RESTORE R0, R1
```

```
;SAVE R0, R1
D POLL  LDI    R1, DSR
        BRz p  D POLL
        STI    R0, DDR
;RESTORE R0, R1
```

```
BRnzp  NEXT_TASK
KBSR    .FILL  xFE00
KBDR    .FILL  xFE02
DSR     .FILL  xFE04
DDR     .FILL  xFE06
```

- Reading & writing from keyboard or display is common task
 - Inefficient to keep repeating this code
 - Need to free up R1 and R0 for use whenever blocks run
 - Save/restore current values before/after these blocks run

Repeating code

- Consider $f(x) = x^4 + 4x^3 + 3x^2 + 2x + 1$
- Evaluate $f(2)$
 - How many multiplications?

Repeating code – why?

- Consider $f(x) = x^4 + 4x^3 + 3x^2 + 2x + 1$
- Evaluate $f(2)$
 - How many multiplications?
- Suppose we wish to evaluate $f(x)$ for many values of x
 - Why? E.g. [Newton-Raphson](#) method for finding roots of $f(x)$

Issues?

- Limited amount of GPRs - polling display & keyboard uses up two of them
- Code often repeated - inefficient to keep inserting same code over & over again
- Human error - keeping track of registers & having direct access to hardware registers is recipe for unforced errors & bugs

Solution?

- Subroutines & repeated code
 - Also called *functions*
- TRAP routines
- More next time ...
