<u>Ludwig Boltzmann</u> (1844-1906)	<u>Willard Gibbs</u> (1839-1903)	<u>Gustav Zeuner</u> (1828-1907)	<u>Johannes der Waals</u> (1837-1923)

Heat Transfer: Radiation

- All things radiate electromagnetic energy

→ $H_{\text{emit}} = Q/t = eA\sigma T^4$

» e = emissivity (between 0 and 1)

■ perfect “black body” has $e=1$

» T is temperature of object in Kelvin

» σ = Stefan-Boltzmann constant = $5.67 \times 10^{-8} \text{ J/s-m}^2\text{-K}^4$

→ No “medium” required

DEMO

- All things absorb energy from surroundings

→ $H_{\text{absorb}} = eA\sigma T_0^4$

» T_0 is temperature of surroundings in Kelvin

» good emitters (e close to 1) are also good absorbers

Heat Transfer: Radiation

- All things radiate and absorb electromagnetic energy

$$\rightarrow H_{\text{emit}} = eA\sigma T^4$$

$$\rightarrow H_{\text{absorb}} = eA\sigma T_0^4$$

$$\rightarrow H_{\text{net}} = H_{\text{emit}} - H_{\text{absorb}} = eA\sigma(T^4 - T_0^4)$$

» if $T > T_0$, object cools down

» if $T < T_0$, object heats up

Bridge Set from Last Wed

A volume of N_2 is compressed through three processes as shown. Which process has the greatest decrease in the average kinetic energy of the molecules?

- A. a to d B. b to d C. c to d

Only process where T goes down is c to d and average KE depends only on Temp.

Thermodynamic processes: Question 1 (N = 269)

First Law of Thermodynamics = Energy Conservation

The change in internal energy of a system (ΔU) is equal to the heat flow into the system (Q) minus the work done *by* the system (W)

$$\Delta U = Q - W$$

Change in internal energy of system (depends on its Temperature)

Heat flow into system

Work done by system (Negative of work done on the gas)

Bridge Set from Last Wed.

$$\Delta U = Q - W$$

- A cylinder that has a piston contains one mole of H_2 and undergoes an expansion that doubles the initial volume of the gas. How much heat is transferred to or from the gas? (assume constant P)
- 1) Heat flows into gas by amount greater than W
 - 2) Heat flows into gas by amount less than W
 - 3) Heat flows out of gas by amount greater than W
 - 4) Heat flows out of gas by amount less than W

Heat flow and work done: Question 1 (N = 270)

First Law of Thermodynamics

Isobaric Example

2 moles of monatomic ideal gas is taken from state 1 to state 2 at constant pressure $p=1000 \text{ Pa}$, where $V_1=2\text{m}^3$ and $V_2=3\text{m}^3$ Find $T_1, T_2, \Delta U, W, Q$. ($R=8.31 \text{ J/k mole}$)

$$1. PV_1 = nRT_1 \Rightarrow T_1 = PV_1/nR = 120\text{K}$$

$$2. PV_2 = nRT_2 \Rightarrow T_2 = PV_2/nR = 180\text{K}$$

$$3. \Delta U = (3/2) nR \Delta T = 1500 \text{ J}$$

$$\Delta U = (3/2) p \Delta V = 1500 \text{ J (has to be the same)}$$

$$4. W = p \Delta V = 1000 \text{ J}$$

$$5. Q = \Delta U + W = 1500 + 1000 = 2500 \text{ J}$$

First Law of Thermodynamics

Isochoric Example

2 moles of monatomic ideal gas is taken from state 1 to state 2 at constant volume $V=2\text{m}^3$, where $T_1=120\text{K}$ and $T_2=180\text{K}$ Find Q .

1. $Q = \Delta U + W$

2. $\Delta U = (3/2) nR \Delta T = 1500 \text{ J}$

3. $W = P \Delta V = 0 \text{ J}$

4. $Q = \Delta U + W = 1500 + 0 = 1500 \text{ J}$

Comparing it to last slide where we had a constant pressure process (and same T_1 & T_2): **Less heat is required to raise T at const. volume than at const. pressure**

First Law Questions

$$\Delta U = Q - W$$

Change in internal energy of system

Heat flow into system

Work done by system

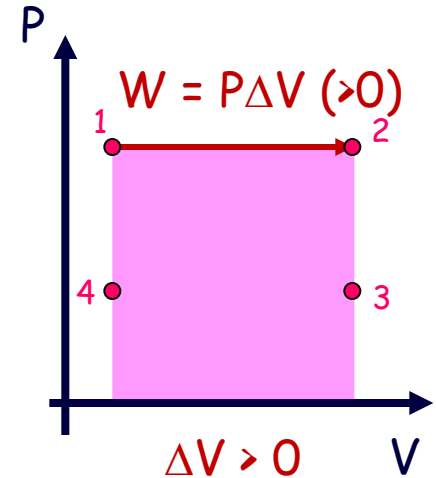

Some questions:

- Which part of cycle has largest magnitude change in internal energy, ΔU ?
 $2 \rightarrow 3$ (since $\Delta U = 3/2 (p_3 V_3 - p_2 V_2) = 3/2 nR \Delta T$)
- Which part of cycle involves the most work done by system?
 $1 \rightarrow 2$ is most (positive), $3 \rightarrow 1$ is 0, $2 \rightarrow 3$ is negative. Net W is POSITIVE
- What is change in internal energy for full cycle?
 $\Delta U = 0$ for closed cycle (since both p & V [and T] are back where they started)
- What is net heat into system for full cycle (positive or negative)?
 $\Delta U = 0 \Rightarrow Q = W = \text{area of triangle} (>0)$

Special PV Cases

- Constant Pressure (isobaric)

- Constant Volume (isochoric)

- Constant Temp $\Delta U = 0$ (isothermal)

- Adiabatic $Q=0$

Reversible?

- Most “physics” processes are reversible: you could play movie backwards and still looks fine. (drop ball vs throw ball up)
- Exceptions:
 - ➔ Non-conservative forces (friction)
 - ➔ Heat Flow:
 - » Heat never flows spontaneously from cold to hot

Summary:

➔ 1st Law of Thermodynamics: Energy Conservation

$$\Delta U = Q - W$$

Change in internal energy of system
(Depends only on Temperature)

Heat flow into system

Work done by system
(Negative of work done on the gas)

- point on p-V plot completely specifies state of system ($pV = nRT$)
- work done is area under curve
- U depends only on T ($U = 3nRT/2 = 3pV/2$)
- for a complete cycle $\Delta U=0 \Rightarrow Q=W$
