

The next three questions pertain to the situation described below.

Consider the collection of two charges separated in the x-axis by a distance $2d$:

1) Where should we place a negatively charged test particle so that it is not subject to a force?

- Point R
- Point Q
- Point P

2) Now place the negative test charge at point Q. Which statement below is correct?

- The test charge is stable to a slight perturbation in the x direction
- The test charge is stable to a slight perturbation in the y direction
- The test charge is stable to a slight perturbation in both x and y directions

3) Write an expression for the force on a negatively charged test particle of charge $-q$ at location P. (\hat{x} and \hat{y} are unit vectors in the x and y directions.)

- $-\frac{2kq^2}{(d^2+r^2)}$
- $-\frac{2kq^2r}{(d^2+r^2)^{3/2}}\hat{y}$
- $-\frac{2kq^2d}{(d^2+r^2)^{3/2}}\hat{y}$
- $-\frac{2kq^2dr}{(d^2+r^2)^2}\hat{x}$
- $\frac{2kq^2r}{(d^2+r^2)^{3/2}}\hat{x}$

The next three questions pertain to the situation described below.

A uniformly charged semi-circular line with linear charge density λ is placed in the x-y plane as shown in the Figure on the right. Its radius is r and its total charge $Q = 15 \mu\text{C}$.

4) If $r = 5 \text{ cm}$, what is λ ?

- a. $\lambda = 48 \mu\text{C/m}$
- b. $\lambda = 95 \mu\text{C/m}$
- c. $\lambda = 150 \mu\text{C/m}$

5) What is the correct expression for the x-component of the total electric field at the origin, E_x , due to this charge?

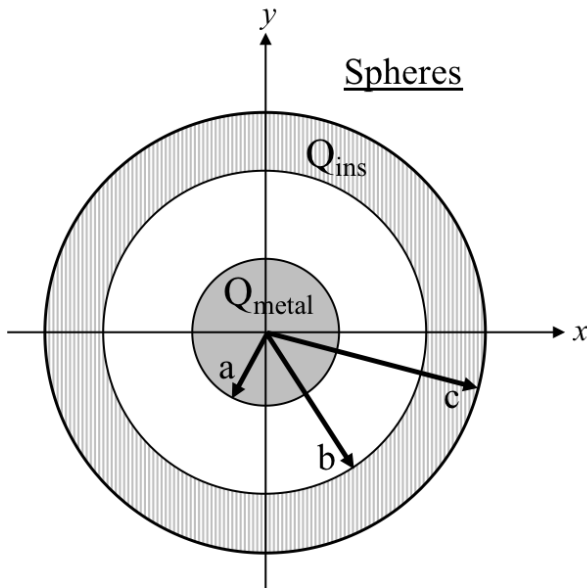

- a. $E_x = - \int_{-\pi/2}^{\pi/2} \frac{k\lambda}{r^2} \cos\theta \, d\theta$
- b. $E_x = - \int_{-\pi/2}^{\pi/2} \frac{k\lambda}{r} \cos\theta \sin\theta \, d\theta$
- c. $E_x = 0$
- d. $E_x = - \int_{-\pi/2}^{\pi/2} \frac{k\lambda}{r} \sin\theta \, d\theta$
- e. $E_x = - \int_{-\pi/2}^{\pi/2} \frac{k\lambda}{r} \cos\theta \, d\theta$

6) What kind of point charge should be placed at point $\mathbf{P}(-r, 0)$ in order to make the net electric field at the origin vanish?

- a. There is no such charge
- b. Positive charge
- c. Negative Charge

The next four questions pertain to the situation described below.

A metal conducting sphere of radius a is centered on the origin. Concentric with it is a spherical shell made of insulating material of inner radius b and outer radius c . A total positive charge Q_{metal} is placed on the inner metal sphere, while a total negative charge Q_{insul} is uniformly distributed over the volume of the outer insulating sphere. The values of all parameters are given in the figure below. The figure is not drawn to scale.

$$\begin{aligned} a &= 5 \text{ cm} \\ b &= 9 \text{ cm} \\ c &= 17 \text{ cm} \\ Q_{\text{metal}} &= 6 \text{ } \mu\text{C} \\ Q_{\text{insul}} &= -4 \text{ } \mu\text{C} \end{aligned}$$

7) Calculate the surface charge density on the inner metal sphere at $a = 5 \text{ cm}$

- $\sigma = 190 \text{ } \mu\text{C}/\text{m}^2$
- $\sigma = 2 \times 10^4 \text{ } \mu\text{C}/\text{m}^2$
- $\sigma = 19 \text{ } \mu\text{C}/\text{m}^2$

8) Calculate the magnitude of the electric field E at a radius of 7 cm from the origin.

- $|E| = 1.1 \times 10^7 \text{ N/C}$
- $|E| = 1.8 \times 10^7 \text{ N/C}$
- $|E| = 7.7 \times 10^5 \text{ N/C}$

9) Calculate the magnitude of the electric field E at a radius of 13 cm from the origin.

- $|E| = 8.2 \times 10^6 \text{ N/C}$
- $|E| = 7.4 \times 10^7 \text{ N/C}$
- $|E| = 2.4 \times 10^6 \text{ N/C}$
- $|E| = 0 \text{ N/C}$
- $|E| = 5.3 \times 10^6 \text{ N/C}$

10) An infinite line charge having $\lambda = 4 \mu\text{C/m}$ is now added parallel to the z-axis and centered at $(x,y) = (-30 \text{ cm}, 0)$, as shown. Find the magnitude of electric field at a point P located at $(x,y) = (-21.5 \text{ cm}, 0)$. (The figure is not drawn to scale. Here we assume the line charge does not affect the surface charge distribution on the metal sphere.)

- a. $|\mathbf{E}| = 7.2 \times 10^6 \text{ N/C}$
- b. $|\mathbf{E}| = 8.5 \times 10^5 \text{ N/C}$
- c. $|\mathbf{E}| = 1.9 \times 10^6 \text{ N/C}$
- d. $|\mathbf{E}| = 1.9 \times 10^5 \text{ N/C}$
- e. $|\mathbf{E}| = 4.6 \times 10^5 \text{ N/C}$

The next three questions pertain to the situation described below.

The electric field due to two point charges is given as a cross sectional view in the x-y plane. There are two points labeled A and B on the graph.

11) What is the position of the point charges?

- a. A positive charge at (1,0) and a negative charge at (0,0)
- b. A positive charge at (0,0) and a negative charge at (0,1)
- c. A positive charge at (0,1) and a negative charge at (0,0)

12) Which of these lines is an equipotential?

- a. $y=0.5$
- b. $y=0$
- c. $x=0.5$
- d. $x=1$
- e. $x=0$

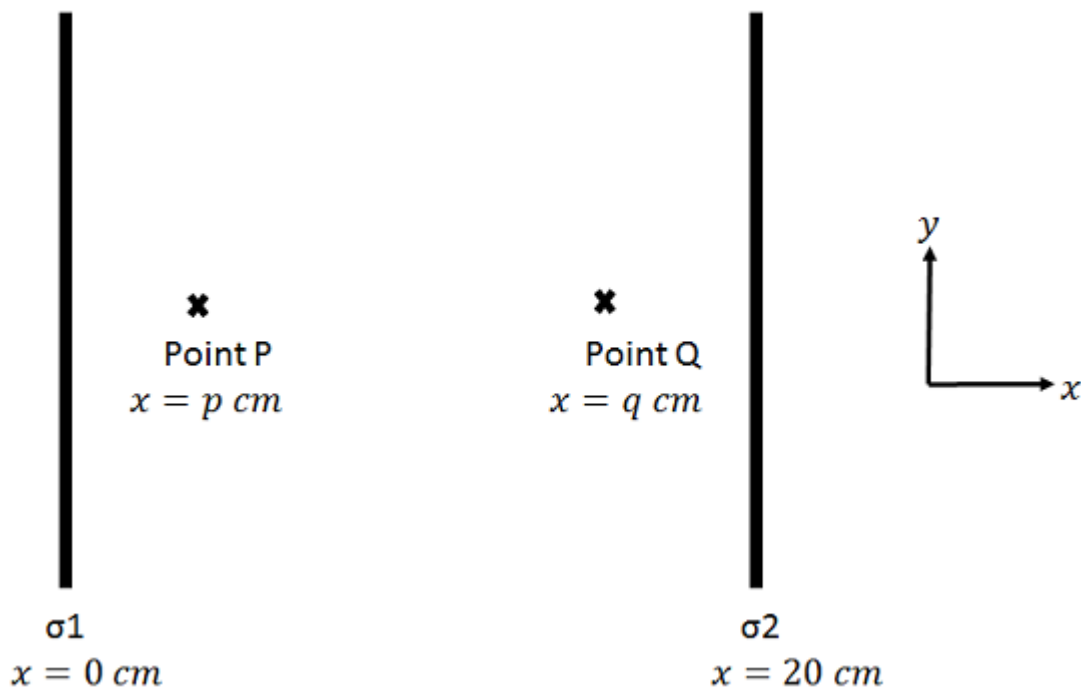

13) What is the relationship between the potential at A and B?

- a. $V_A > V_B$
- b. $V_A < V_B$
- c. $V_A = V_B$

The next three questions pertain to the situation described below.

As seen in Figure 1, two charged, infinite plates have charge densities of $\sigma_1 = 5 \mu\text{C}/\text{m}^2$ and $\sigma_2 = 9 \mu\text{C}/\text{m}^2$ and are placed at $x = 0 \text{ cm}$ and $x = 20 \text{ cm}$ respectively.

Figure 1

14) What is the potential difference between point Q, $(q \text{ cm}, 0 \text{ cm})$ and point P, $(p \text{ cm}, 0 \text{ cm})$? Let $q = 17 \text{ cm}$ and $p = 2 \text{ cm}$.

- a. $\Delta V = 84 \text{ kV}$
- b. $\Delta V = 120 \text{ kV}$
- c. $\Delta V = 34 \text{ kV}$
- d. $\Delta V = 280 \text{ kV}$
- e. $\Delta V = 230 \text{ kV}$

15) For the next two problems, consider Figure 2.

Figure 2

A slab of metal with no net charge (shaded region; left edge at $x = 9 \text{ cm}$, right edge at $x = 11 \text{ cm}$) is now placed between the two charged, infinite plates.

What are the surface charge densities for the left side of the slab (given by σ_L) and the right side of the slab (given by σ_R)?

- a. $\sigma_L = -7 \mu\text{C}/\text{m}^2, \sigma_R = 7 \mu\text{C}/\text{m}^2$
- b. $\sigma_L = -2 \mu\text{C}/\text{m}^2, \sigma_R = 2 \mu\text{C}/\text{m}^2$
- c. $\sigma_L = 2 \mu\text{C}/\text{m}^2, \sigma_R = -2 \mu\text{C}/\text{m}^2$
- d. $\sigma_L = 0 \mu\text{C}/\text{m}^2, \sigma_R = 0 \mu\text{C}/\text{m}^2$
- e. $\sigma_L = 7 \mu\text{C}/\text{m}^2, \sigma_R = -7 \mu\text{C}/\text{m}^2$

16) With the addition of the metal slab, what is the potential difference between point Q and point P?

- a. $\Delta V = 100 \text{ kV}$
- b. $\Delta V = 34 \text{ kV}$
- c. $\Delta V = 0 \text{ kV}$
- d. $\Delta V = 29 \text{ kV}$
- e. $\Delta V = 120 \text{ kV}$

The next two questions pertain to the situation described below.

Three capacitors and an ideal battery are connected as shown in the figure below. The voltage of the battery is $U = 9 \text{ V}$. The capacitances of the capacitors are $C_1 = 4 \text{ }\mu\text{F}$, $C_2 = 4 \text{ }\mu\text{F}$, and $C_3 = 6 \text{ }\mu\text{F}$.

17) Capacitors C_2 and C_3 are connected _____

- a. in series
- b. in parallel
- c. neither in parallel nor in series

18) What is the total energy stored in all three capacitors?

- a. $120 \text{ }\mu\text{J}$
- b. $570 \text{ }\mu\text{J}$
- c. $26 \text{ }\mu\text{J}$
- d. $230 \text{ }\mu\text{J}$
- e. $1100 \text{ }\mu\text{J}$

The next two questions pertain to the situation described below.

A parallel plate capacitor is constructed with a dielectric slab with $\kappa = 1.7$ inserted between the plates. The area of each plate is 6 cm^2 , and the distance between the two plates is 2 mm . Assume the infinite plane approximation.

19) If we fix the charge on the capacitor to be $Q = 6 \times 10^{-11} \text{ C}$, what is the potential difference between the top and bottom plates? Note that in the region containing the dielectric medium, the electric field is $E = E_0 / \kappa$, where E_0 is the electric field in vacuum.

- a. $\Delta V = 18 \text{ V}$
- b. $\Delta V = 6.6 \text{ V}$
- c. $\Delta V = 11 \text{ V}$
- d. $\Delta V = 23 \text{ V}$
- e. $\Delta V = 4.2 \text{ V}$

20) If the dielectric slab is removed, the capacitance of the capacitor will

- a. remain the same
- b. decrease
- c. increase
