Physics 180
Nuclear Weapons, Nuclear War, and Arms Control
Frederick K. Lamb

Final Examination With Answers
2001 May 11

Name ______________________________________________________

ID No. ________________________________

• This is a closed book examination.

• You have the full class period (180 minutes) to complete it.

• Answer all questions on all ten topics. Each topic is worth 20 points. The point value of each question within a topic is indicated.

• Write your answers in the space provided on these pages. Do not submit any additional pages. (If you need more room, write on the back of the page.)

• For full credit on definitions, give numbers where appropriate.

SCORES

1. __20__ 6. __20__

2. __20__ 7. __20__

3. __20__ 8. __20__

4. __20__ 9. __20__

5. __20__ 10. __20__

TOTAL SCORE __200__
1. Acronyms

Decode in one phrase the following acronyms, abbreviations, or code words. [1 point each]

ALCM — Air-launched cruise missile
ASAT — Anti-satellite weapon
ATBM — Anti-tactical ballistic missile
C³I — Communications, command, control, and intelligence
EMP — Electromagnetic pulse
EMT — Equivalent megatonnage
GPS — Global Positioning System
MIRV — Multiple independently-targetable reentry vehicle
NATO — North Atlantic Treaty Organization
NORAD — North American Aerospace Defense Command
R&D — Research and development
SALT — Strategic Arms Limitation Talks
SIOP — Single Integrated Operational Plan
SLBM — Submarine-launched ballistic missile
SLCM — Sea-launched cruise missile
START — Strategic Arms Reduction Talks
TMD — Theater missile defense
Triad — The three types of U.S. SNDVs (bombers, ICBMs, and SLBMs)
Trinity — The code-name of the first nuclear weapon test
TTBT — Threshold Test Ban Treaty
2. Nuclear Physics

Define *nuclear fission*. [3 points]

*Nuclear fission is the breakup of a heavy nucleus, such as uranium, into two medium-weight nuclei. Fission is usually accompanied by emission of a few neutrons and γ-rays.*

Define *fissile nuclide*. [3 points]

*A fissile nuclide has some probability of being fissioned by a neutron of any energy. [A non-fissile but fissionable nuclide can only be caused to fission by neutrons with energies above the fission threshold energy.]*

Name two fissile nuclides. [2 points]

*Three fissile nuclides relevant to the course are U-233, U-235, and Pu-239. [Full credit given for listing any two of these nuclides.]*

Explain what is meant by a *subcritical*, a *critical*, and a *supercritical* assembly. [6 points]

*A subcritical assembly of nuclear materials is one in which there are fewer fissions in each successive generation; stated differently, the neutron multiplication factor is less than one.*

*A critical assembly is one in which the same number of fissions is the same in each successive generation; stated differently, the neutron multiplication factor is exactly one.*

*A supercritical assembly of nuclear materials is one in which there are more fissions in each successive generation; stated differently, the neutron multiplication factor is greater than one.*

What is the diameter and prompt critical mass of a bare sphere of 100% U-235? [2 points]

8.5 cm and 56 kg
(full credit given for answers in the ranges 5–10 cm and 40–70 kg)

What is *reactor-grade* plutonium? *Weapon-grade* plutonium? What are the key differences between them? [3 points]

*Reactor-grade [high burn-up] plutonium contains more of the isotopes Pu-240, Pu-241, and Pu-242 than does weapon-grade plutonium. [Full credit given for listing Pu-240 alone.]*

Could a terrorist group build and explode a device made of reactor-grade plutonium? [1 point]

Yes, reactor-grade plutonium can be made to explode.
3. Thermonuclear Weapons

a) Shown here is a schematic diagram of a standard thermonuclear weapon. Indicate on the diagram the locations of the following key components:

- $^6$LiD fusion packet
- U-238 case
- Fission trigger
- Blast shield for fusion packet
- Styrofoam and reflectors

b) Describe briefly the functions of each of these five components. [10 points]

$^6$LiD fusion packet: *The thermonuclear 'fuel' of the weapon. When exposed to neutrons, the $^6$Li acts as a 'catalyst', providing more neutrons and tritium to fuse with the deuterium (D), releasing energy.*

U-238 case: *Has two purposes: holds the weapon together, increasing the yield of the fusion packet and fissions when exposed to the intense neutron flux from the fusion reactions, adding to the fission yield of the weapon.*

Fission trigger: *Provides the X- and $\gamma$-rays that compress and heat the fusion packet, causing the thermonuclear reaction to go.*

Blast shield for fusion packet (tamper): *Slows propagation of the debris and shock wave from the fission trigger into the fusion packet, allowing the fusion reaction to proceed for some time before the fusion packet is disrupted.*

Styrofoam and reflectors: *Styrofoam holds the fusion packet in place and, when exposed to the X- and $\gamma$-rays from the fission trigger, creates a high-pressure plasma that helps to compress the fusion packet. Reflectors direct X- and $\gamma$-rays onto the surface of the fusion packet.*
4. ICBMs

a) What is an ICBM? [2 points]

An ICBM (intercontinental ballistic missile) is a land-based missile capable of striking targets at intercontinental distances, usually defined as distances of 5500 km or more.

b) List the four phases in the flight of a MIRVed ICBM and indicate the approximate duration of each in minutes. [8 points]

<table>
<thead>
<tr>
<th>PHASE</th>
<th>DURATION (MINUTES)</th>
</tr>
</thead>
<tbody>
<tr>
<td>i) Boost</td>
<td>1-5</td>
</tr>
<tr>
<td>ii) Post-boost</td>
<td>5</td>
</tr>
<tr>
<td>iii) Midcourse</td>
<td>20</td>
</tr>
<tr>
<td>iv) Terminal</td>
<td>0.5-1</td>
</tr>
</tbody>
</table>

c) What is the approximate flight time in minutes for U.S. ICBMs to typical targets in the Soviet Union? If one was launched in error, could the U.S. do anything to prevent its warheads from exploding? [2 points]

30 minutes. No.

d) Define the following terms used in discussions of ICBMs and explain their significance. [4 points]

CEP: The radius of a circle that encloses half (and only half) of the impact points of the RVs.

Bias: The distance between the aimpoint and the center of the distribution of RV impact points.

e) Name two technologies that are used to guide or to help guide the warheads of modern ICBMs to their targets. [4 points]

Inertial guidance, star trackers, global positioning satellites. [Any two are sufficient for full credit.]

f) Does the ability of a missile to destroy a hardened target depend more on the yield of the warhead it carries or the accuracy with which it can deliver the warhead? [2 points]

The accuracy with which it can deliver the warhead.
5. Weapon Effects

Give brief (one- or two-sentence) definitions of the following terms. [2 points each]

- **Air burst**—A burst above ground-level in which the fireball never touches the ground.

- **Surface burst**—A burst at or above ground-level in which the fireball touches the ground at some point in the evolution of the explosion.

- **Electromagnetic pulse (EMP)**—The strong burst of electromagnetic radiation produced by a nuclear explosion.

- **Thermal pulse**—The pulse of heat radiation emitted by the fireball of a nuclear explosion after it has expanded for several seconds.

- **Blast wave**—The shock wave (a very strong sound wave) produced by a strong explosion of any kind.

- **Half-life**—The time after which there is a 50% probability that a given radionuclide has decayed. [For a macroscopic quantity of a given radionuclide, the time after which the amount still remaining has fallen to half the original amount. Note that the half-life can be defined only for a single radionuclide, since a mixture of radionuclides will have a mixture of half-lifes.]

- **Ionizing radiation**—Radiation (UV, X-rays, and γ-rays) that is energetic enough to strip electrons from atoms and molecules.

- **Acute exposure**—Exposure to radiation lasting less than 24 hours. [To be distinguished from chronic exposure, which is exposure lasting more than 24 hours.]

- **Physical dose**—The energy deposited in the target tissue or material by the incident radiation. Measured in rads.

- **Relative biological effectiveness**—The factor that describes the relative effectiveness of the particular type of radiation in causing the type of biological damage of interest; converts a dose in rads into a dose in rems.
6. Nuclear Policies

Give short (one or two sentence) definitions of each of the following nuclear policies and give the approximate time interval, if any, during which it was declared U.S. policy (you may specify the interval by giving a range of years or presidential administrations). [4 points each]

• Counterforce—A policy of emphasizing the ability to quickly launch devastating attacks on the leadership and nuclear forces of an adversary. Major elements of this policy include a large arsenal of prompt, hard-target killer weapons (powerful and accurate); a large menu of pre-programmed targets; quick and effective early warning; and communications, command, and control, and post-attack assessment capabilities, to permit shoot-look-shoot tactics to assure complete destruction of the adversary’s forces. This has been operational U.S. policy since the mid-1960s and declared U.S. policy since the early 1970s.

• Assured destruction—A policy of deploying secure retaliatory nuclear forces of sufficient size to destroy any attacker, even after a first strike is absorbed. The emphasis is on the security of the forces and command and control, and their sufficiency for deterrence. This was declared U.S. strategic policy during 1963-1973.

• No first use—A policy of promising never to be the first to use nuclear weapons in a conflict, even if one is losing a conventional war. This has never been declared U.S. or NATO nuclear policy.

• Minimal deterrence—A policy of deterring nuclear attack by deploying only the nuclear forces needed to cause unacceptable damage to the population and industry of any attacker. The emphasis of this policy is on avoiding an arms race while still deterring nuclear attack. Defense Secretary Robert McNamara reportedly considered 400 deliverable EMTs sufficient to deter the Soviet Union from attacking the U.S. This has never been U.S. nuclear policy.

• Massive retaliation—A policy of attempting to deter even a very small conventional attack by threatening to retaliate with an all-out attack utilizing all available nuclear weapons. This was official U.S. policy throughout the Eisenhower administration and was associated with the name of Secretary of State John Foster Dulles. Its purpose was to save money by relying on nuclear weapons while cutting back drastically on conventional forces.
7. Nuclear Arms Control Treaties

Three treaties that limit nuclear testing are listed below. For each treaty—
- Give the year the agreement was signed and state whether the treaty is now in force
- Describe which nations are parties to the agreement
- List the key provisions and the duration of the agreement
- Describe one way compliance with the agreement can be monitored

- Limited Test Ban Treaty (LTBT) [7 points]
  

  Parties: Original signatories were US, UK, and SU; now signed by more than 100 nations.

  Key provisions: Prohibits testing of nuclear weapons in the atmosphere, underwater, and in space. Of unlimited duration (with the usual escape clause in case of supreme national interest).

  One method of monitoring: Air-sampling of radionuclides/satellite detection of double optical flash. [Either example is sufficient.]

- Second Strategic Arms Reduction Treaty (START II) [7 points]

  Year/in force? Signed in January 1993; not yet in force. [It was ratified in January 1996 by the U.S. Congress but has not yet been ratified by the Russian Duma.]

  Parties: US and Russia.

  Key provisions: Limits US and RUssia to no more than 3,500 strategic nuclear warheads. Eliminates MIRVed ICBMs. Of unlimited duration (with the usual escape clause in case of supreme national interest).

  One method of monitoring: Overhead photoreconnaissance using satellites; interception of missile test telemetry; collection of infrared signatures using early-warning satellites. Listing any one of these methods is sufficient for full credit.

- Comprehensive Test Ban Treaty (CTBT) [6 points]

  Parties: Signed by 94 countries; India has refused to sign.

  Key provisions: Bans all nuclear explosions of any size and for any purpose.

  One method of monitoring: Monitoring methods include remote monitoring by networks of seismic sensors, hydroacoustic sensors, radionuclide detectors, and infrasound sensors as well as on-site inspections. [Listing any one of these methods is sufficient for full credit.]
8. Proliferation

List the seven countries that openly possess nuclear weapons (the declared nuclear weapons states). Give the year in which each first exploded a nuclear device. [14 points]

List any countries that are thought to have nuclear weapons, even though they do not acknowledge having them (de facto nuclear weapon states). [2 points]

Israel.

Which previously de facto nuclear weapon state recently gave up its nuclear weapons and agreed to the provisions of the Non-Proliferation Treaty? [1 point]

South Africa.

Give short (two- or three-sentence) definitions of the following terms. [3 points]

- **Enrichment**—Physical processing of fissionable material by means such as gaseous diffusion, centrifugal separation, and laser separation, to increase the fraction of the material that is fissile. An example is enrichment of natural uranium (mostly U-238) to increase the fraction of nuclei that are fissile (U-235).

- **Reprocessing**—Chemical processing of fissionable material to separate desired nuclides from undesired nuclides. An example is processing of partially-used reactor fuel to separate Pu-239 from the fuel, for use in making nuclear weapons.

- **Dual-use technologies**—Technologies that can be used either for peaceful purposes or to produce nuclear weapons.
9. The Non-Proliferation Treaty (NPT)

The NPT divides signatories into nuclear-weapon states and non-nuclear-weapon states.

• What are the major restrictions on the nuclear-weapon states, under the terms of the treaty? [4 points]

NWS must not transfer nuclear weapons or control over nuclear weapons to any NNWS, directly or indirectly. [Article I]

NWS must not assist, encourage, or induce any NNWS to manufacture or otherwise acquire nuclear weapons or other nuclear explosive devices, or control over such weapons or explosive devices. [Article I]

• What are the major obligations of the nuclear-weapon states, under the terms of the treaty? [4 points]

NWS agree to help NNWS with "potential benefits from any peaceful applications of nuclear explosions". [Article V]

NWS agree to pursue negotiations in good faith to end the nuclear arms race at an early date and to move toward nuclear disarmament. [Article VI]

• What are the major restrictions on the non-nuclear-weapon states, under the terms of the treaty? [4 points]

NNWS must not receive nuclear weapons or other nuclear explosive devices, or control over such weapons or devices, directly or indirectly. [Article II]

NNWS must not manufacture or otherwise acquire nuclear weapons and must not seek or receive any assistance in the manufacture of nuclear weapons or other nuclear explosive devices. [Article II]

NNWS must accept IAEA safeguards to prevent diversion of nuclear energy from peaceful uses to nuclear weapons or other nuclear explosive devices. [Article III]

• Under the terms of the treaty, what conditions, if any, are there on the transfer or sale of nuclear reactors and related peaceful nuclear technologies to non-nuclear-weapon states? [4 points]

None. [Article IV]

• Under the terms of the treaty, after 25 years a conference must be held at which the treaty must be extended indefinitely, extended for another definite period, or canceled. What is the status of this conference? [4 points]

It was held in 1995 and extended the NPT indefinitely.
10. Anti-Ballistic Missile (ABM) Weapons

- Has the U.S. ever had an operational ABM weapon system? If so, when was it operational and for how long? [2 points]

Yes, the U.S. had an operational ABM system in 1976, for three months. [It was turned off after three months because it was too expensive and ineffective.]

- List the “non-nuclear-weapon” or “undeclared-nuclear-weapon” states that have tested or soon will test ballistic missiles with ranges greater than 1,500 km. [3 points]

Saudia Arabia, India, and Israel

- Are any of these countries current or prospective adversaries of the U.S. or its allies? If so, which? [2 points]

No.

- List three countries that are regarded by the U.S. as “states of concern”, because they are considered unfriendly and might develop ballistic missiles capable of reaching the U.S. within the next 10 years. [3 points]

North Korea, Iran, and Iraq.

- Explain what is meant by “boost-phase intercept” and describe one advantage of such a system compared to a “mid-course intercept” system. [3 points]

Interceptor and destruction of a missile during the powered portion of its flight, which is called the “boost” phase. Compared to interception during mid-course, there is only one object that must be destroyed (the missile) rather than the many warheads that may be present during the mid-course phase; the missile is easier to locate than a warhead, because of the bright rocket plume coming out of it; and decoys and spoofing are harder to make effective than in the mid-course phase. Full credit was given for any of these. (There are disadvantages to boost-phase intercept systems, such as the necessity of completing the detection, identification, tracking, and intercept within the ~200 second typical duration of the boost phase.

- What is the stated goal of the Bush administration’s proposed $100 billion ABM program, according to Secretary of Defense Donald Rumsfeld? [2 points]

“To complicate the planning of the attacker.”

- U.S. ABM programs have never attempted to counter delivery of nuclear weapons by which of the following methods: submarine-launched ballistic missiles, bombers, air-launched cruise missiles, sea-launched cruise missiles, ground-launched cruise missiles, ships, trucks. [3 points]

All of the above.

- How does the Bush administration plan to reconcile its proposed nation-wide ABM system with the ABM Treaty, which bans testing and deployment of such a system? [2 points]

By withdrawing from the treaty.
