

Airborne Particle Resuspension

Group 7:

Jake Rosenbaum, Michael Gachich, Nicholas Jung, Samriddhi Bhatia

Project Recap

- Measure and characterize particle resuspension, primarily as a function of mechanical disturbance (i.e., car passings, people walking).
- Ultimately to be done in a large control environment and outdoors.
- No model exists for suspension of this nature, and though the creation of such model is beyond the scope of this project, we aim to capture the necessary data.

Experimental Setup

Experimental Setup

Data Acquisition

- Code begins when battery pack is plugged in
- Initial 30 second plantower warmup
- Introduce variable (Turn on fan, test particle, etc)
- Run for n iterations (Currently 400)
- Wait 1 minute for environment to stabilize
- Repeat with other particles/conditions

Analysis - Outdoor Tests

Future Experiments and Analysis

- Remote trigger start.
- Large scale indoor tests: fans, different seed sizes/materials, mechanical disturbance via different vehicle sizes and speeds.
- Outdoor tests on - Various Surfaces: asphalt, cement, dirt.
Wind Conditions: predominantly weak, as well as in various locations.
- More devices!
- (Possibly) important statistics: Characteristic decay time, correlation between car size and speed.
