# HALL PROBE MEASUREMENT OF MAGNETIC FIELDS

*Spring 2013*  
*Eugene V. Colla*

# Hall Probe Measurement of Magnetic Field.

## The main goals of the Lab:

- ✓ Study of the magnetic field distribution created by various systems using Hall probe and Gauss meter.
- ✓ Calculating for simple systems the magnetic field profile and comparing it with experimental data.
- ✓ Getting understanding of the application of the Hall effect to measurements of the magnetic fields.

**This is one week Lab**

# Outline

- ✓ **Magnetic field due to current loops**
- ✓ **Helmholtz coils**
- ✓ **Solenoid**
- ✓ **Halbach magnets**
- ✓ **Hall effect. Measuring of the magnetic field**

# Biot-Savart Law.

Jean-Baptiste Biot  
(1774-1862)

Félix Savart  
(1791-1841)

$$d\vec{B} = \frac{\mu_0}{4\pi} \frac{I d\vec{l} \times \vec{r}}{r^3}$$

$\mu_0 = 4\pi 10^{-7} \text{ N/A}^2$ ,  
permeability of the  
free space

# Magnetic field due to current loops.

$$|d\vec{l}| = a d\phi$$

$$dB_z = dB \cos \theta = dB \frac{a}{|\vec{r}|}$$

$$dB_z = \frac{\mu_0}{4\pi} \frac{a^2 d\phi}{|\vec{r}|^3}$$

$$B_z = \oint dB_z = \frac{\mu_0 I}{4\pi} \frac{a^2}{|\vec{r}|^3} \oint d\phi = \frac{\mu_0 I}{2} \frac{a^2}{|\vec{r}|^3} = \frac{\mu_0 I}{2} \frac{a^2}{(z_1^2 + a^2)^{\frac{3}{2}}}$$

# Helmholtz coils.

**Hermann Ludwig  
Ferdinand von  
Helmholtz  
(1821-1894)**

**Magnetic field vector in a plane  
bisecting the current loops.  
(courtesy Wikipedia)**

# Helmholtz coils. Field along the axis.

**N turns**

For single loop:

$$\vec{B} = \left\{ \frac{\mu_0 I}{2} \frac{a^2}{(z_1^2 + a^2)^{\frac{3}{2}}} \right\} \hat{z}$$

For Helmholtz coils total current equals  $NI$ ,

$$z \rightarrow z - \frac{a}{2} \quad \text{For right hand coil and}$$

$$z \rightarrow z + \frac{a}{2} \quad \text{for left hand coil}$$

# Helmholtz coils. Field along the axis.

Finally:

$$\vec{B} = \frac{\mu_0 N I a^2}{2} \left\{ \frac{a^2}{\left[ \left( z + \frac{a}{2} \right)^2 + a^2 \right]^{\frac{3}{2}}} + \frac{a^2}{\left[ \left( z - \frac{a}{2} \right)^2 + a^2 \right]^{\frac{3}{2}}} \right\} \hat{z}$$

or

$$\vec{B} = \frac{\mu_0 N I}{2a} \left\{ \frac{1}{\left[ \left( \frac{z}{a} + \frac{1}{2} \right)^2 + 1 \right]^{\frac{3}{2}}} + \frac{1}{\left[ \left( \frac{z}{a} - \frac{1}{2} \right)^2 + 1 \right]^{\frac{3}{2}}} \right\} \hat{z}$$

# Helmholtz coils. Distance between the coils.

## 1. $a=2R$

# Helmholtz coils. Distance between the coils.

## 1. $a=1.5R$

# Helmholtz coils. Distance between the coils.

3.  $a=R$

# Helmholtz coils. Distance between the coils.

## 4. $a=0.5R$

# Helmholtz coils. Distance between the coils.

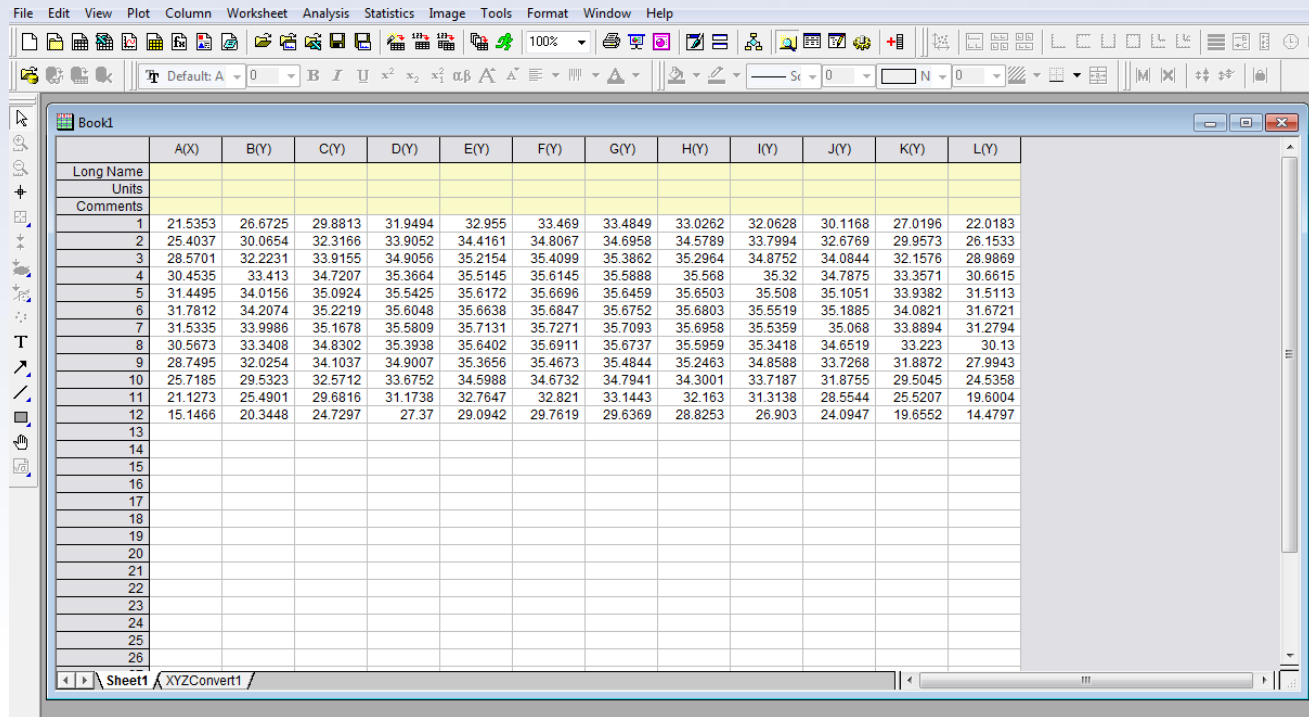

**In the  $z$  range  $-a/4 \div a/4$  the field uniformity is better than 0.5%**

# 3D data visualization of the mapping data.

The results of 2D field mapping can be presented in 3D plot

## Step#1. Plugin your data in the worksheet

The screenshot shows a spreadsheet application window titled 'Book1'. The spreadsheet has columns labeled A(X) through L(Y) and rows numbered 1 through 26. The data is as follows:

	A(X)	B(Y)	C(Y)	D(Y)	E(Y)	F(Y)	G(Y)	H(Y)	I(Y)	J(Y)	K(Y)	L(Y)

# 3D data visualization of the mapping data.

## Step#2. Convert data to matrix

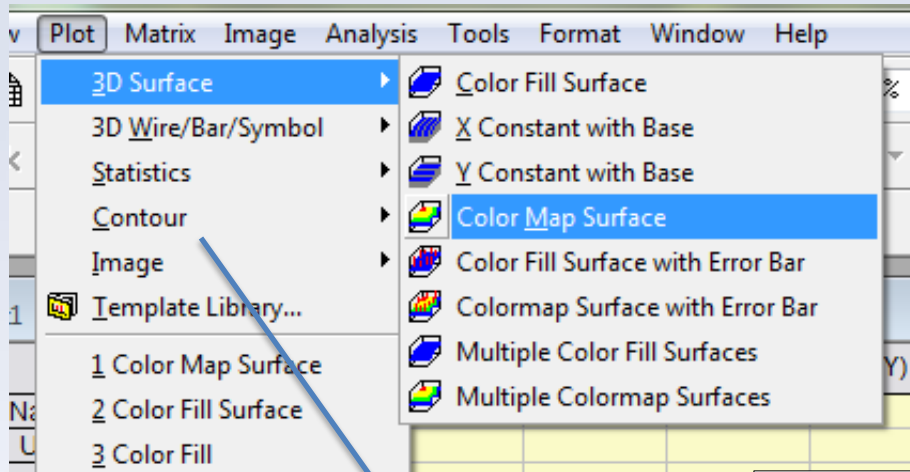

The screenshot shows the OriginPro 8.5.1 interface. The 'Worksheet' menu is open, and the 'Convert to Matrix' option is selected. A sub-menu is visible with 'Direct' chosen, and an 'Open Dialog...' button is highlighted. In the background, a data table is visible with columns labeled F(Y) through L(Y). In the foreground, a window titled 'MBook5 :1/1' displays a 12x12 matrix of numerical data.

	1	2	3	4	5	6	7	8	9	10	11	12
1	21.5353	26.6725	29.8813	31.9494	32.955	33.469	33.4849	33.0262	32.0628	30.1168	27.0196	22.0183
2	25.4037	30.0654	32.3166	33.9052	34.4161	34.8067	34.6958	34.5789	33.7994	32.6769	29.9573	26.1533

# 3D data visualization of the mapping data.

**Step#3. Plot (here is the color map chosen but you have many options how to plot)**

**Color map surface**

# Helmholtz coils. Summary

Helmholtz coils can produce the pretty uniform magnetic field in large volume free of material. Helmholtz coils are not very suitable to generate high magnetic fields.

**Helmholtz coils in Rb optical pumping experiment. UIUC Physics 403**

**Helmholtz coil from Brookhaven National Laboratory**

# Solenoids.

**Solenoids are another source of the uniform magnetic field. Solenoids could be used to produce very high magnetic field.**

# Solenoids. Magnetic field along the axis.

Magnetic field generated by length  $dz$ :

$$\vec{B} = \left\{ \frac{\mu_0 n I dz}{2} \frac{a^2}{(z_1^2 + a^2)^{3/2}} \right\} \hat{z}$$

Here  $n$  is number of turns per unit length and  $I$  – solenoid current

To calculate the magnetic field generated by the whole length of the solenoid we need to perform the integrating from  $z_1$  to  $z_2$

# Solenoids. Magnetic field along the axis.

Field from current loop

$$\vec{B} = \left\{ \frac{\mu_0 n I dz}{2} \frac{a^2}{(z_1^2 + a^2)^{\frac{3}{2}}} \right\} \hat{z}$$

$n$  – turns per unit length  
 $I$  – solenoid current

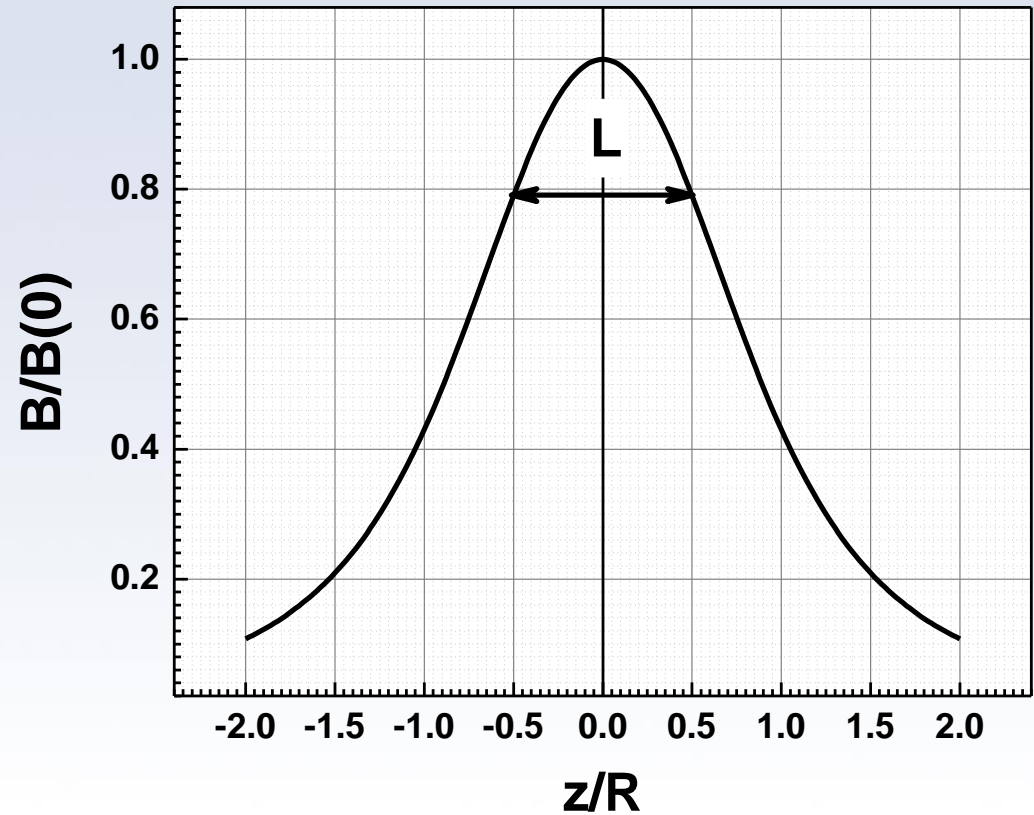

Making the changing variables  $z = \frac{a}{\tan \theta}$

$$\vec{B} = -\frac{\mu_0 n I}{2} \int_{\theta_1}^{\theta_2} \sin \theta d\theta \hat{z} = \frac{\mu_0 n I}{2} [\cos \theta_1 - \cos \theta_2] \hat{z}$$

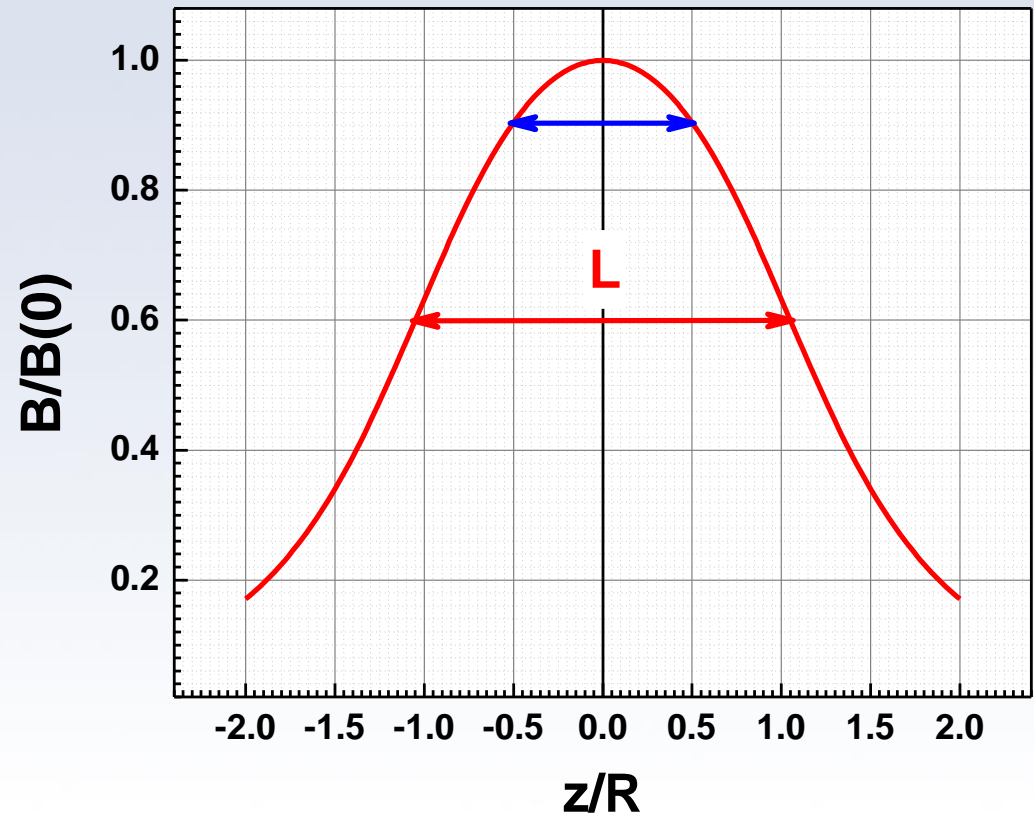

where  $\cos(\theta_1) = \frac{z_1}{\sqrt{a^2 + z_1^2}}$ ;  $\cos(\theta_2) = \frac{z_2}{\sqrt{a^2 + z_2^2}}$

# Solenoids. How uniform the field is.

# Solenoids. How uniform the field is.

# Solenoids. How uniform the field is.

# Solenoids. How uniform the field is.

To create the uniform field in solenoid you need you need to wind a long coil with  $L \gg R$

# Solenoids vs. Helmholtz coil.

Helmholtz coil  $\frac{\Delta B}{B} \leq 6\%$

Solenoid  $\frac{\Delta B}{B} > 20\%$

$$L=R$$

# Solenoids. Calculation of the magnetic field for ideal solenoid using Ampere's law.

André-Marie Ampère  
(1775-1836)

$$\oint \vec{B} \cdot d\vec{l} = \mu_0 NI$$

$B_z = B$  (inside),  $B_z = 0$  (outside),  $B_y = 0$

$$0 + LB + 0 + 0 = \mu_0 NI$$

and  $B = \frac{\mu_0 NI}{L} = \mu_0 nI$  where  $n = N/L$

# Solenoids. Rates of change of transverse and z-components of $\vec{B}$ .

$$\vec{\nabla} \cdot \vec{B} = \frac{\partial B_x}{\partial x} + \frac{\partial B_y}{\partial y} + \frac{\partial B_z}{\partial z} = 0$$

$$\frac{\partial B_x}{\partial x} = \frac{\partial B_y}{\partial y}$$

$$\frac{\partial B_z}{\partial z} = -2 \frac{\partial B_x}{\partial x}$$

# Superconducting solenoids sources of the very high magnetic fields

from  **CRYOMAGNETICS, INC.**  
INNOVATIVE SUPERCONDUCTING MAGNET SOLUTIONS

22T magnet from

Units: **1T=10<sup>4</sup>G**; typical fields reachable in your experiments **<100G**

# Halbach magnets

**Klaus Halbach**  
1924-2000

The late Klaus Halbach of Lawrence Berkeley National Laboratory discovered an interesting permanent magnet configuration that concentrates magnetic flux on one side of the array and cancels it on the other

# Hall effect

Edwin Herbert Hall  
(1855-1938)

The current in x direction could be written as:  $\vec{I}_x = NqAv_x \hat{x}$

where **N** is the concentration of carriers, **q** is carrier charge and **A** is a cross-section area of the bar and  $v_x$  – drift velocity.

# Hall effect

After the field application in z direction the carriers experience a force:

$$\vec{F} = q\vec{v} \times \vec{B} = q \left( \frac{I_x}{NqA} \hat{x} \right) \times B_z \hat{z} = -\frac{I_x B_z}{NA} \hat{y}$$

This force will produce the deflection of the carriers resulting in extra charges on the surfaces normal to y axis. Extra charges will give a rise to an electric field  $E_y$ . The electric field will exerts a force on carriers in the direction opposite the magnetic force. Carriers will flow in y direction until both forces balance:

$$qE_y \hat{y} - \frac{I_x B_z}{NA} \hat{y} = 0 \quad \text{or} \quad E_y = \frac{I_x B_z}{qNA}$$

The equilibrium field could be determined by measuring the potential difference across the sample.

$$V_H = - \int_{-a/2}^{a/2} E_y dy = -E_y a \quad \mathbf{a} - \text{width of the bar}$$

# Hall effect

Finally

$$V_H = \frac{I_x B_z}{qNb}$$

(b is a thickness of the bar, A=ab)

Let define

$$R_H = \frac{1}{Nq}$$

as a Hall coefficient

And expression for Hall voltage could be rewritten as

$$V_H = R_H \frac{I_x B_z}{b}$$

Table 1

Material	$R_H$ ( $\text{m}^3/\text{C}$ )
Cu	$-5.3 \times 10^{-11}$
Na	$-21.0 \times 10^{-11}$
Cr	$+35.0 \times 10^{-11}$
Bi	$-10^3 \times 10^{-11}$
InAs (approx.)	$-10^7 \times 10^{-11}$

# Setup

**X-Y scanning equipment**

**Hall probe scanning the  
"iron box" magnet**

Be smart! Do not forget about the symmetry of the investigated magnetic system.

$$B(r, \varphi) = f(r) \neq f(\varphi)$$

Magnetic field created with the circular loop (solenoid, Helmholtz coil) depends only on radius  $r$  but not on the angle  $\varphi$
