

Lecture 5 - Diffraction and Recip. Lat. - continued

Solid State Physics 460- Lecture 5 Diffraction and the Reciprocal Lattice Continued (Kittel Ch. 2)

Ewald Construction

Physics 460 F 2006 Lect 5 1

Recall from previous lectures

- Definition of a crystal – **Lattice + Basis**
- Reciprocal lattice – **Lattice in Fourier space (reciprocal space)**
- Diffraction from crystals – **Bragg Condition – $2d \sin \theta = n \lambda$**
- Diffraction and the reciprocal lattice
- Today:
 - Diffraction and the reciprocal lattice continued – **Ewald construction and the Brillouin Zone (BZ)**

Physics 460 F 2006 Lect 5 2

Recall from Lecture 3 Summary: Real and Reciprocal lattices

- Crystal lattice of translations: $\mathbf{T}(n_1, n_2, \dots) = n_1 \mathbf{a}_1 + n_2 \mathbf{a}_2 + n_3 \mathbf{a}_3$ Primitive vectors
- Reciprocal lattice: $\mathbf{G}(m_1, m_2, \dots) = m_1 \mathbf{b}_1 + m_2 \mathbf{b}_2 + m_3 \mathbf{b}_3$, where $\mathbf{b}_i \cdot \mathbf{a}_j = 2\pi \delta_{ij}$, where $\delta_{ij} = 1, \delta_{ij} = 0, i \neq j$
- Any periodic function can be written $\mathbf{f}(\mathbf{r}) = \sum_{\mathbf{G}} \mathbf{f}_{\mathbf{G}} \exp(i \mathbf{G} \cdot \mathbf{r})$
- Information about the basis for the actual crystal is in the values of the Fourier coefficients $\mathbf{f}_{\mathbf{G}} = (1/V_{\text{cell}}) \int_{\text{cell}} d^3r \mathbf{f}(\mathbf{r}) \exp(-i \mathbf{G} \cdot \mathbf{r})$

Kittel Ch. 2

Physics 460 F 2006 Lect 5 3

Recall from Lecture 3 Bragg Scattering Law

- Condition for constructive interference (Diffraction): $2d \sin \theta = n \lambda$
- Maximum $\lambda = 2d$
- Only waves with λ smaller than $2d$ can satisfy the Bragg scattering law for diffraction
- For a typical crystal the maximum $d \sim 0.1 - 1 \text{ nm}$, so that $\lambda < \sim 0.1 - 1 \text{ nm}$

Physics 460 F 2006 Lect 5 4

Recall from Lecture 3 Scattering and Fourier Analysis

- Note that \mathbf{k} is a vector in reciprocal space with $|\mathbf{k}| = 2\pi/\lambda$.
- The in and out waves have the form: $\exp(i \mathbf{k}_{\text{in}} \cdot \mathbf{r} - i \omega t)$ and $\exp(i \mathbf{k}_{\text{out}} \cdot \mathbf{r} - i \omega t)$
- If the incoming wave drives the electron density, which then radiates waves, the **amplitude** of the outgoing wave is proportional to: $\int_{\text{space}} d\mathbf{r} n(\mathbf{r}) \exp(i (\mathbf{k}_{\text{in}} - \mathbf{k}_{\text{out}}) \cdot \mathbf{r})$

Physics 460 F 2006 Lect 5 5

Recall from Lecture 3 Scattering and Fourier Analysis

- Define $\Delta \mathbf{k} = \mathbf{k}_{\text{in}} - \mathbf{k}_{\text{out}}$
- Then we know from Fourier analysis that $(1/V_{\text{cell}}) \int_{\text{cell}} d\mathbf{r} n(\mathbf{r}) \exp(-i \Delta \mathbf{k} \cdot \mathbf{r}) = n_{\mathbf{G}}$ only if $\Delta \mathbf{k} = \mathbf{G}$, where \mathbf{G} is a reciprocal lattice vector
- Otherwise the integral vanishes

Note: These statements are for a perfect crystal of size \rightarrow infinity. See prob. Kittel 2.4 for a finite crystal where the scattering is peaked at $\Delta \mathbf{k} = \mathbf{G}$ with a finite width. Physics 460 F 2006 Lect 5

6

Lecture 5 - Diffraction and Recip. Lat. - continued

Recall from Lecture 3

Elastic Scattering

- For elastic scattering (energy the same for in and out waves)
 - $|k_{in}| = |k_{out}|$, or $k_{in}^2 = k_{out}^2 = |k_{in} + G|^2$
- Then one arrives at the condition for diffraction: (using G in expression above)
 - $2 k_{in} \cdot G = G^2$
 - G is any one of the recip. lattice vectors
- Equivalent to the Bragg condition – see next lecture

Physics 460 F 2006 Lect 5 7

Ewald Construction

G is any one of the recip. lattice vectors

- Condition for diffraction:
 - $k_{out} = k_{in} + G$
 - and
 - $|2 k_{in} \cdot G| = |G|^2 = 2 |k_{in}| |G| \sin \theta$
- $\Rightarrow |G| = 2 |k_{in}| \sin \theta$
 - (note sine function, not cosine)
 - Why? Discussed in class

Physics 460 F 2006 Lect 5 8

Equivalent to Bragg Condition

- From last slide,
 - $|G| = 2 |k_{in}| \sin \theta$
- But $|k_{in}| = 2\pi/\lambda$, and $|G| = n (2\pi/d)$, where d = spacing between planes (see homework, Kittel prob. 2-1)
- \Rightarrow Bragg condition $2d \sin \theta = n \lambda$

Physics 460 F 2006 Lect 5 9

Geometric Construction of Diffraction Conditions

- Recall $k_{in} - k_{out} = G$ and $|k_{in}| = |k_{out}|$
- Consequence of condition
 - $|2 k_{in} \cdot G| = G^2$
- The vector k_{in} (and k_{out}) lies along the perpendicular bisecting plane of a G vector
- One example is shown

Physics 460 F 2006 Lect 5 10

Diffraction and the Brillouin Zone

- Brillouin Zone - (BZ)** - the Wigner-Seitz cell of the reciprocal lattice
- Formed by perpendicular bisectors of G vectors
- Special Role of Brillouin Zone**
 - Diffraction occurs only for k on surface of Brillouin Zone
 - No diffraction occurs for any k inside the first Brillouin Zone
 - Important later in course

Physics 460 F 2006 Lect 5 11

Comparison of diffraction from different lattices

- The Bragg condition can also be written
 - $|G| = 2 |k_{in}| \sin \theta$
 - $\Rightarrow \sin \theta = (\lambda / 4\pi) |G|$
- Thus the ratios of the sines of the angles for diffraction are given by:
 - $\sin \theta_1 / \sin \theta_2 = |G_1| / |G_2|$
- Each type of lattice has characteristic ratios the positions of diffraction peaks as a function of $\sin \theta$
- Simple scaling with λ

Physics 460 F 2006 Lect 5 12

Lecture 5 - Diffraction and Recip. Lat. - continued

Experimental Powder Pattern

- Diffraction peaks at angles satisfying the Bragg condition
- Experimental example

Intensity

h [r.l.u.]

40 grains
200 grains

Differences for imperfect powder averages

Reciprocal Lattice units

<http://www.uni-wuerzburg.de/mineralogie/crystal/teaching/teaching.html>

Physics 460 F 2006 Lect 5 13

Comparison of diffraction from different lattices

- Ratios $\sin \theta_i / \sin \theta_0 = |G_i| / |G_0|$, where θ_0 is the lowest angle peak (smallest G)
- Easiest to give ratios of squares G_i^2 / G_0^2

Simple Cubic lattice

(G in units of $2\pi/a$)

G_i	G_i^2	ratio
1,0,0	1	1
1,1,0	2	2
1,1,1	3	3
2,0,0	4	4
2,1,0	5	5

Physics 460 F 2006 Lect 5 14

Comparison of diffraction from different lattices - continued

FCC real space lattice (G in units of $2\pi/a$)			BCC real space lattice (G in units of $2\pi/a$)		
G_i	G_i^2	ratio	G_i	G_i^2	ratio
1,1,1	3	1	1,1,0	2	1
2,0,0	4	4/3	2,0,0	4	2
2,2,0	8	8/3	2,1,1	6	3
3,1,1	11	11/3	2,2,0	8	4
2,2,2	12	4	3,1,0	10	5
4,0,0	16	1/3	2,2,2	12	6

Same ratios as Simple cubic!

Physics 460 F 2006 Lect 5 15

Example of KCl, KBr

- See Kittel Fig. 17
- KCl and KBr have fcc structure – expect fcc “powder patterns”
- But KCl has a special feature
 - K⁺ and Cl⁻ have the same number of electrons, they scatter x-rays almost the same ---- thus KCl has
 - a pattern like simple cubic

Why does this happen?

Physics 460 F 2006 Lect 5 16

Comparison of diffraction from different lattices - continued

- Lower symmetry lattices
- Example - **Orthorhombic**

$$\mathbf{G} = (n_1 \frac{2\pi}{a_1}, n_2 \frac{2\pi}{a_2}, n_3 \frac{2\pi}{a_3})$$
 - Lengths of G's are in general not any special numbers since the a's can be in any ratios
 - Many lines in diffraction pattern because of many different values of $|G|$
- Hexagonal** - length along c axis not related to lengths perpendicular to c axis

Physics 460 F 2006 Lect 5 17

Fourier Analysis of the basis

- The intensity of the diffraction at each G is proportional to the square of the amplitude of the Fourier component

$$n_G = (1/V_{\text{cell}}) \int_{\text{cell}} dr n(r) \exp(-i \mathbf{G} \cdot \mathbf{r})$$
- It is also possible to regard the crystal density $n(r)$ as a sum of atomic-like densities $n^{\text{atom } i}(r - R_i)$, centered at point R_i

$$n(r) = \sum_{\text{all } i} n^{\text{atom } i}(r - R_i)$$
- Then also

$$n_G = \sum_{i \text{ in cell}} \int_{\text{space}} dr n^{\text{atom } i}(r - R_i) \exp(-i \mathbf{G} \cdot \mathbf{r})$$

Physics 460 F 2006 Lect 5 18

Lecture 5 - Diffraction and Recip. Lat. - continued

One atom per cell and Form Factor

- Then one can set $R_i = 0$ and n_G is the Fourier transform of one atom density

$$n_G = \int_{\text{space}} dr n^{\text{atom}}(r) \exp(-i \mathbf{G} \cdot \mathbf{r})$$

- Called **Form Factor**
- Example in Kittel

Physics 460 F 2006 Lect 5

19

More than one atom per cell

- $$n_G = \sum_{i \text{ in cell}} \int_{\text{space}} dr n^{\text{atom } i}(\mathbf{r} - \mathbf{R}_i) \exp(-i \mathbf{G} \cdot \mathbf{r})$$

$$= \sum_{i \text{ in cell}} \exp(-i \mathbf{G} \cdot \mathbf{R}_i) \int_{\text{space}} dr n^{\text{atom } i}(\mathbf{r} - \mathbf{R}_i) \exp(-i \mathbf{G} \cdot (\mathbf{r} - \mathbf{R}_i))$$

$$= \sum_{i \text{ in cell}} \exp(-i \mathbf{G} \cdot \mathbf{R}_i) \int_{\text{space}} dr n^{\text{atom } i}(\mathbf{r}) \exp(-i \mathbf{G} \cdot \mathbf{r})$$

$$= \sum_{i \text{ in cell}} \exp(-i \mathbf{G} \cdot \mathbf{R}_i) n_G^{\text{atom } i}$$
- Interpretation: **Structure Factor = Form factor** $n_G^{\text{atom } i}$ **x phase factor** $\exp(-i \mathbf{G} \cdot \mathbf{R}_i)$ for each atom in unit cell

Physics 460 F 2006 Lect 5

20

Structure factor

- Often the basis contains more than one atom that is same element, e.g., **diamond structure**
- Then $n_G^{\text{atom } i} = n_G^{\text{atom } j}$ is the same for each i and

$$n_G = \sum_{i \text{ in cell}} \exp(-i \mathbf{G} \cdot \mathbf{R}_i) n_G^{\text{atom } i}$$

$$= n_G^{\text{atom}} \sum_{i \text{ in cell}} \exp(-i \mathbf{G} \cdot \mathbf{R}_i)$$

- Define **"pure" structure factor**

$$S_G^0 = (1/N_{\text{cell}}) \sum_{i \text{ in cell}} \exp(-i \mathbf{G} \cdot \mathbf{R}_i)$$

where N_{cell} = number of atoms in cell

- Then $n_G = N^0 S_G^0 n_G^{\text{atom}}$

NOTE - Kittel defines n_G to be the "structure factor"

Physics 460 F 2006 Lect 5

21

Body Centered Cubic viewed as Simple Cubic with 2 points per cell

$$S_G^0 = (1/2) \sum_{i=1,2} \exp(-i \mathbf{G} \cdot \mathbf{R}_i)$$

$$= (1/2) (1 + \exp(-i \mathbf{G} \cdot \mathbf{R}_2))$$

$$= (1/2) \exp(-i \mathbf{G} \cdot \mathbf{R}_2/2) [\exp(i \mathbf{G} \cdot \mathbf{R}_2/2) + \exp(-i \mathbf{G} \cdot \mathbf{R}_2/2)]$$

$$= \exp(-i \mathbf{G} \cdot \mathbf{R}_2/2) \cos(\mathbf{G} \cdot \mathbf{R}_2/2)$$

Result: If $\mathbf{G} = (v_1 v_2 v_3) 2\pi/a$
 $|S_G^0| = 1$ if sum of integers is even
 $|S_G^0| = 0$ if sum is odd

Points at $\mathbf{R}_1 = (0,0,0)$;
 $\mathbf{R}_2 = (1,1,1) a/2$

Same as we found before!
FCC reciprocal lattice

Physics 460 F 2006 Lect 5

22

Face Centered Cubic viewed as Simple Cubic with 4 points per cell

$$S_G^0 = (1/4) \sum_{i=1,4} \exp(-i \mathbf{G} \cdot \mathbf{R}_i)$$

Result:

If $\mathbf{G} = (v_1 v_2 v_3) 2\pi/a$ then

$S_G^0 = 1$ if all integers are odd or all are even

$S_G^0 = 0$ otherwise

Same as we found before!
BCC reciprocal lattice

Points at $(0,0,0)$; $(1,1,0) a/2$;
 $(1,0,1) a/2$; $(0,1,1) a/2$

Physics 460 F 2006 Lect 5

23

Structure factor for diamond

- Example: diamond structure

$$S_G^0 = (1/2) \sum_{i=1,2} \exp(-i \mathbf{G} \cdot \mathbf{R}_i)$$

$$\mathbf{R}_1 = + (1/8, 1/8, 1/8)a$$

$$\mathbf{R}_2 = - (1/8, 1/8, 1/8)a$$

- Homework problem

- Similar approach would apply to a graphite plane

Physics 460 F 2006 Lect 5

24

Lecture 5 - Diffraction and Recip. Lat. - continued

Summary - Diffraction & Recip. Lattice

- Bragg Condition for diffraction
- Fourier Analysis and the Reciprocal Lattice
 $\mathbf{G}(m_1, m_2, \dots) = m_1 \mathbf{b}_1 + m_2 \mathbf{b}_2 + m_3 \mathbf{b}_3$,
 where the \mathbf{b} 's are primitive vectors defined by
 $\mathbf{b}_i \cdot \mathbf{a}_j = 2\pi \delta_{ij}$, where $\delta_{ij} = 1$, $\delta_{ij} = 0$, $i \neq j$
- Examples of Reciprocal lattice: fcc, bcc, ...
- Ewald Construction
- Diffraction for \mathbf{k}_{in} , \mathbf{k}_{out} in planes - perp. bisectors of \mathbf{G} 's
- Defines Brillouin Zone - no diffraction in first BZ
- Information about the actual crystal is in the values of the Fourier coefficients f_G
 $f_G = (1/V_{cell}) \int_{cell} dr f(r) \exp(-i \mathbf{G} \cdot \mathbf{r})$
- Form factor, "Pure" Structure factor

Physics 460 F 2006 Lect 5 25

Quasicrystals

- Not periodic in sense described before
- Example a crystal with periodicity a with a density wave that is a different period a' with a'/a not a rational number
 $n(x) = n_1 \cos(2\pi x/a) + n_2 \cos(2\pi x/a')$
never repeats!
- Examples in higher dimensions
 Orientation order without translational order
Penrose Tiles
 Five fold symmetry in x-ray patterns

Physics 460 F 2006 Lect 5 26

Penrose Tiles

- Many examples
 Nice WWW sites

http://www.traipse.com/penrose_tiles/index.html

See this site for a Java program for Penrose tiles
<http://www.geocities.com/SiliconValley/Pines/1684/Penrose.html>

Physics 460 F 2006 Lect 5 27

Next Time

- Crystal Binding (Chapter 3)

Physics 460 F 2006 Lect 5 28
