

How to Read a Physics Paper— The Four i's +1

Celia M. Elliott and Brian DeMarco
Department of Physics
University of Illinois at Urbana-Champaign

*with thanks to Igor Roshchin, Texas A&M, who first gave me the idea,
and Lance Cooper, Laura Greene, and Kevin Pitts, U. Illinois*

Why read papers, and what kind?

Peer-reviewed papers are the primary means of communication in physics

Three broad categories:
 High profile (first time) results
 Detailed methods & results
 Review: synthesis by expert(s)

Preprints (not peer reviewed)
 Most current research

[arXiv](https://arxiv.org)
[ChemRxiv](https://chemrxiv.org)
[OSF Preprints](https://osf.io) (all disciplines)
[ESS Open Archive](https://essopenarchive.org) (earth & space)

2

How do you decide on what to read?

Learn about a new development in your area:

Focus on results in PRL or PRA (BCDE)- like journals

New formalism or methods are in methods & formalisms (or in the supplement)

3

How do you decide on what to read?

Learn about a new development in your area:

Focus on results in PRL or PRA (BCDE)- like journals

New formalism or methods are in methods & formalisms (or in the supplement)

Learn something new (physics is interconnected):

Start with review papers, books, and theses

First focus on broad understanding

Then pick up on details concerning the physics, methods, and results!

4

A screening and reading method

The four *i*'s (+1)

Importance

Iteration

Interpretation

Integration

5

The first *i*: importance

Does the paper contain information (methods, results, conclusions) that has implications for your research?

Read the title and the abstract

Look at the author list and their affiliations

Read the conclusions

Look at the figures and captions

Look at the references

Is the paper worth reading? Study or go on?

Observation of Bose-Einstein Condensation in a Dilute Atomic Vapor

M. H. Anderson, J. R. Ensher, M. R. Matthews, C. E. Wieman,*
E. A. Cornell

A Bose-Einstein condensate was produced in a vapor of rubidium-87 atoms that was confined by magnetic fields and evaporatively cooled. The condensate fraction first appeared near a temperature of 170 nanokelvin and a number density of 2.5×10^{10} per cubic centimeter and could be preserved for more than 15 seconds. Three primary signatures of Bose-Einstein condensation were seen. (i) On top of a broad thermal velocity distribution, a narrow peak appeared that was centered at zero velocity. (ii) The fraction of the atoms that were in this low-velocity peak increased abruptly as the sample temperature was lowered. (iii) The peak exhibited a nonthermal, anisotropic velocity distribution expected of the minimum-energy quantum state of the magnetic trap in contrast to the isotropic thermal velocity distribution observed in the broad uncondensed fraction.

M. H. Anderson, J. R. Ensher, M. R. Matthews, C. E. Wieman, JILA, National Institute of Standards and Technology (NIST), and University of Colorado, and Department of Physics, University of Colorado, Boulder, CO 80309, USA.

E. A. Cornell, Quantum Physics Division, NIST, JILA-NIST, and University of Colorado, and Department of Physics, University of Colorado, Boulder, CO 80309, USA.

*To whom correspondence should be addressed.

Fig. 1. Schematic of the apparatus. Six laser beams intersect in a glass cell, creating a magneto-optical trap (MOT). The cell is 0.5 cm square by 12 cm long, and the beams are 1.5 cm in diameter. The coils generating the fixed quadrupole and rotating transverse components of the TOP trap magnetic fields are shown in green and blue, respectively. The glass cell hangs down from a steel chamber (not shown) containing a vacuum pump and rubidium source. Also not shown are coils for injecting the rf magnetic field for evaporation and the additional laser beams for imaging and optically pumping the trapped atom sample.

6

Second *i*: iterate

1. Skim the article and identify its structure

Many (not all) physics papers:

**Introduction, Methods (brief), Results,
Discussion, sometimes Methods (again)
Conclusions, References**

2. Find main points of each section

3. Generate questions: active reading

4. Read to answer those questions

5. Iterate!

**Turn on your skepticism filter and
take notes as you read!**

7

Second *i*: iterate *(continued)*

**Take the paper apart, section by section, and
identify the key ideas**

Highlight anything you don't understand

**Cross-check the narrative with the figures and
tables**

**Go back and re-read your highlighted sections;
refer to the references or supplementary info**

**Repeat until you thoroughly understand the
parts of interest to you**

8

The third *i*: interpret

Put the paper aside and write down the key ideas in your own words

Check what you've written against the paper; have you correctly represented the information and emphasis of the original paper?

Are there parts that you still don't understand? (go back to *iteration*)

Do you agree with what the authors have said? Have they provided sufficient detail and supporting evidence? (Again: turn on your **skepticism filter)**

9

The final *i*: integrate

Evaluate how the information presented in the paper fits with what you already know

Does it contradict something that you believe?

Does it raise new questions that you should investigate?

Does it describe a method that you could use?

Is it something that you should refer to in the future? (If so, how are you going to keep track of it?)

The four *i*'s of mindful reading

10

+1: Storing information for future access

Devise a system to keep track of what you read

Store pdfs of important papers on your computer,
(i.e., create your own library)

Categorize the papers in some sensible way

Name papers in a way that can jog your memory

Many software solutions are available

(https://en.Wikipedia.org/wiki/Comparison_of_reference_management_software)

Popular choices (some supported by the Library)

Mendeley, Zotero, RefWorks, EndNote

Consult your adviser and senior students in

your group and get their recommendations

11

Now for the practical bits...

12

Here's one way to deconstruct a paper
Read the abstract and write down the main ideas you think the paper will present

PRL **107**, 117401 (2011)

PHYSICAL REVIEW LETTERS

9 SEPTEMBER 2011

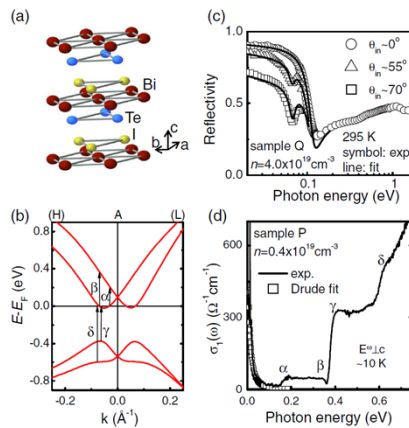

Optical Response of Relativistic Electrons in the Polar BiTeI Semiconductor

J. S. Lee,^{1,*} G. A. H. Schober,^{2,3} M. S. Bahramy,⁴ H. Murakawa,⁵ Y. Onose,^{2,5} R. Arita,^{2,4}
N. Nagaosa,^{2,4} and Y. Tokura^{1,2,4,5}

The transitions between the spin-split bands by spin-orbit interaction are relevant to many novel phenomena such as the resonant dynamical magnetoelectric effect and the spin Hall effect. We perform optical spectroscopy measurements combined with first-principles calculations to study these transitions in the recently discovered giant bulk Rashba spin-splitting system BiTeI. Several novel features are observed in the optical spectra of the material including a sharp edge singularity due to the reduced dimensionality of the joint density of states and a systematic doping dependence of the intraband transitions between the Rashba-split branches. These confirm the bulk nature of the Rashba-type splitting in BiTeI and manifest the relativistic nature of the electron dynamics in a solid.

13

Next, look at the figures and tables
Write down a one-sentence description of each

J.S. Lee et al., Phys. Rev. Lett. **107**, 117401 (2011).

- a) Crystal structure of BiTeI; red is Bi, blue is Te, and yellow is I.
- b) Band dispersion points in the *H* and *L* directions; possible optical transitions indicated by arrows with an index of α , β , γ , and δ .
- c) Reflectivity spectra were taken for one sample (Q) at different incident angles, as shown by variations in photon energy (eV).
- d) Optical conductivity spectra were obtained by polarizing light directed normal to the *c* axis (solid line) and compared with a theoretical curve (open squares) based on the Drude model.

14

Next, read the first sentence of each paragraph

Highlight any sentences that you don't understand

Look at the sentences. Can you see a logical progression of ideas?

Summarize the logical argument in a short paragraph

15

Go back to any sentences you highlighted

Study the corresponding paragraph—does it answer your questions?

If you still don't understand the sentence you highlighted, devise a strategy to figure out what it means

Look up key words

Find a review article on the topic

Check the references

Check for supplementary material

Google the author's name to see if she has a research website

16

Read the conclusions section

Have the authors supported their conclusions?

How do their conclusions fit in with what you already know?

Is there anything you don't agree with?

Is there anything that you still don't understand?

How can you resolve the issues?

17

Figure out a way to keep track of this paper

Enter the bibliographic information into your citation manager

In your notes, clearly differentiate direct quotes from the paper and what you've paraphrased

Important: Develop your own method to deconstruct papers

18

To recap:

Importance—first determine if the paper is worth reading

Iterate—go back over sections of the paper until you understand it; consult other sources if necessary

Interpret—summarize the main points in your own words

Integrate—synthesize the ideas with what you already know and believe

Investigate a citation management system to keep track of what you read

19

Final words:

Pro tip: Scan the arXiv each week via RSS feed!

Physics ideas are interconnected—intentionally break out of your silo periodically and read something different

Strive for *mindful reading*; not a linear process, takes practice
