$$\left( \begin{array}{l} \langle \psi | H | \psi \rangle \\ \langle \psi | H | \psi \rangle \end{array} \right) \quad \left( \begin{array}{l} \langle \psi | H | \psi \rangle \\ \langle \psi | H | \psi \rangle \end{array} \right)$$

Two last ingredients to study electronic structure

① Spin

② Time-reversal symmetry

① So far  $G = \mathbb{R}^3 \times O(3)$

electrons have spin  $-\frac{1}{2}$

In the absence of spin-orbit coupling (SOC)

$$H_{e^-} = H_0 \otimes \sigma_0$$

↑  
completely  
spin-independent

←  $2 \times 2$  identity matrix

in the space of electron spin

If we have SOC, we need to use representations of  $SU(2)$  to describe how rotations act on spin

Reminder:  $SU(2)$  - group of  $2 \times 2$  unitary matrices w/

$$g \in SU(2) \quad e^{-i\theta \hat{n} \cdot \sigma / 2} \quad \begin{array}{l} \text{determinant } \bar{1} \\ \text{spin } \frac{1}{2} \\ \text{representation} \end{array}$$

$$\theta \in [0, 2\pi)$$

$$\hat{n} \text{ is a 3d unit vector}$$

$$\theta = 2\pi \quad g = -\sigma_0$$

To encode this, we can extend the Euclidean group by a new element  $\bar{E}$

$$\bar{E}^2 = E$$

$$\rho(\bar{E}) = \text{identity matrix} \quad \ell \in \mathbb{Z}$$

$$\rho(\bar{E}) = -\text{identity matrix} \quad \ell \text{ half-integer}$$

Example:  $I_n \text{ SO}(3) \supset D_2 = \{C_{2x}, C_{2y}, C_{2z}\}$

$$C_{2x} C_{2y} = C_{2z}$$

In  $SU(2)$  Defining representation  $\rho_{1/2}$

$$\rho_{1/2}(C_{2x}) = e^{-i\pi\sigma_x/2} = -i\sigma_x$$

$$\rho_{1/2}(C_{2y}) = e^{-i\pi/2\sigma_y} = -i\sigma_y$$

$$\rho_{\frac{1}{2}}(C_{2z}) = -i\sigma_z$$

$$\begin{aligned}\rho_{\frac{1}{2}}(C_{2x})\rho_{\frac{1}{2}}(C_{2y}) &= (-i\sigma_x)(-i\sigma_y) \\ &= -(i\sigma_z) = \rho_{\frac{1}{2}}(C_{2z})\end{aligned}$$

$$\begin{aligned}\rho_{\frac{1}{2}}(C_{2y})\rho_{\frac{1}{2}}(C_{2x}) &= (-i\sigma_y)(-i\sigma_x) \\ &= +i\sigma_z \\ &= \rho_{\frac{1}{2}}(\bar{E})\rho_{\frac{1}{2}}(C_{2z})\end{aligned}$$

so in  $SU(2)$

$$C_{2x}C_{2y} = \bar{E}C_{2y}C_{2x}$$

Double group of  $D_2$

$$\{ E, C_{2x}, C_{2y}, C_{2z}, \bar{E}, \bar{E}C_{2x}, \bar{E}C_{2y}, \bar{E}C_{2z} \}$$

$$C_{2x}^2 = C_{2y}^2 = C_{2z}^2 = \bar{E} \quad - Q$$

---

$$H = \{ E, \bar{E} \} \triangleleft SU(2)$$

$$SU(2)/H \cong SO(3)$$

1st isomorphism theorem

$SU(2)$  is a double cover  
of  $SO(3)$

For rotations: view (double) point groups  
as subgroups of  $SU(2) \cong Spin(3)$

$$Spin(3)/\{\mathbb{E}, \bar{\mathbb{E}}\} = SO(3)$$

$$\frac{P_{in}(3)}{\{E, \bar{E}\}} \cong O(3)$$

Two possibilities:  $I^2 = \begin{cases} E \leftarrow P_{in-}(3) \\ \bar{E} \leftarrow P_{in+}(3) \end{cases}$

$P_{in-}(3)$  is the physical choice spin- $\frac{1}{2}$ s  
transform like magnetic field

$$\begin{aligned} P_{in-}(3) &= SU(2) \times \{E, I\} \\ &= \{g, gI \mid g \in SU(2) \quad gI = Ig\} \end{aligned}$$

For spin- $\frac{1}{2}$  particles, symmetry groups of Hamiltonians will be subgroups

$$\mathbb{R}^3 \rtimes \text{Pin}_-(3) \supset G \quad \text{double space groups}$$

If  $\eta$  is a representation of a double group

①  $\eta(E) = \eta(\bar{E}) \rightarrow \eta$  is a single-valued representation  
 $\rightarrow \eta$  is also a representation of "ordinary" space groups

(2)  $\chi(E) = -\chi(\bar{E}) \rightarrow \chi$  is a double valued representation.

Ex: double group  $Q$ ,  $222^d$  ← double groups

$$Q = \{ E, C_{2x}, C_{2y}, C_{2z}, \bar{E}, \bar{E}C_{2x}, \bar{E}C_{2y}, \bar{E}C_{2z} \}$$

$$C_{2x} C_{2y} = C_{2z}$$

$$C_{2y} C_{2x} = \bar{E} C_{2z}$$

$$C_{2i}^{-1} = \bar{E} C_{2i}$$

$$C_{zx}^2 = C_{zy}^2 = C_{z\bar{z}}^2 = \bar{E}$$

$$C_{zx} C_{zy} C_{zx}^{-1} = \bar{E} C_{zy} C_{zx} C_{zx}^{-1} = \bar{E} C_{zy}$$

5 conjugacy classes:

$\{E\}$

→ 5 irreducible representations

$\{\bar{E}\}$

|            | E | $\bar{E}$ | $C_{zx}$ | $C_{zy}$ | $C_{z\bar{z}}$ |
|------------|---|-----------|----------|----------|----------------|
| $\Gamma_1$ | 1 | 1         | 1        | 1        | 1              |
| $\Gamma_2$ | 1 | 1         | 1        | -1       | -1             |
| $\Gamma_3$ | 1 | 1         | -1       | 1        | -1             |
| $\Gamma_4$ | 1 | 1         | -1       | -1       | 1              |

$\{C_{zx}, \bar{E} C_{zx}\}$

$\{C_{zy}, \bar{E} C_{zy}\}$

$\{C_{z\bar{z}}, \bar{E} C_{z\bar{z}}\}$

$$\vec{T}_S / 2 \quad -2 \quad 0 \quad 0 \quad 0$$

$T_1, T_2, T_3, T_4$  are  
irreps of  $D_2$  if we  
forget about  $\vec{E}$

$$\vec{T}_S(E) = \sigma_0$$

$$\vec{T}_S(\bar{E}) = -\sigma_0$$

$$\vec{T}_S(C_{2i}) = -i\sigma_i$$

(2) Time-reversal symmetry  $T$

On Hilbert space

$$T \vec{x} T^{-1} = \vec{x}$$

$$T \vec{p} T^{-1} = -\vec{p}$$

But time-reversal cannot be unitary

$$[x_i, p_j] = i\hbar \delta_{ij}$$

$$\begin{aligned} T [x_i, p_j] T^{-1} &= [T x_i T^{-1}, T p_j T^{-1}] \\ &= [x_i, -p_j] \end{aligned}$$

$$= -i\hbar$$

Resolution:  $T$  is an antiunitary operator

Definition of an antiunitary operator:

Let  $\{|v_i\rangle\}$  be a set of basis vectors

$T$  is an antiunitary operator if:

$$\textcircled{1} T(\alpha|v_i\rangle + \beta|v_j\rangle) = \alpha^* T|v_i\rangle + \beta^* T|v_j\rangle$$

$$\begin{aligned} \textcircled{2} \langle T v_j | T v_i \rangle &= \langle v_j | v_i \rangle^* \\ &= \langle v_i | v_j \rangle \end{aligned}$$

we can introduce a matrix

$$Q_T^{ij} = \langle v_i | T v_j \rangle$$

to see how  $T$  acts on a state

$$|v\rangle = \sum_i a_i |v_i\rangle$$

$$\begin{aligned}
T|v\rangle &= \sum_i T(a_i|v_i\rangle) \\
&= \sum_i a_i^* T|v_i\rangle \\
&= \sum_{i,j} a_i^* |v_j\rangle \langle v_j|T|v_i\rangle \\
&= \sum_i \left( \sum_j U_{ji}^* \right) a_i^* |v_j\rangle
\end{aligned}$$

we can say that  $T$  is represented

by  $U_T \mathcal{K}$  ← complex conjugation  
of scalars

$$\mathcal{K}|v_i\rangle = |v_i\rangle$$

$$\mathcal{K}\alpha = \alpha^* \mathcal{K}$$

Given two vectors

$$|v\rangle = \sum_i a_i |v_i\rangle$$

$$|w\rangle = \sum_j b_j |v_j\rangle$$

$$\langle T v | T w \rangle = \langle w | v \rangle = \vec{b}^* \cdot \vec{a}$$

$$\left( \overset{||}{a^T} \cdot U_T^\dagger \right) \left( U_T \vec{b}^* \right)$$

$$U_T^\dagger = U_T^{-1}$$

Antiunitary operators  $T$  can be represented as  $U_T \mathcal{K}$  w/  $U_T$  a unitary matrix

Ex: spin =  $\frac{1}{2}$  particles

$|\uparrow\rangle$   
 $|\downarrow\rangle$  basis states

$$T|\uparrow\rangle = -|\downarrow\rangle$$

$$T|\downarrow\rangle = +|\uparrow\rangle$$

$$"T = i\sigma_y \mathcal{K}"$$

$$i\sigma_y = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}$$

$$\langle \uparrow | T \uparrow \rangle = 0$$

$$\langle \downarrow | T \downarrow \rangle = 0$$

$$\langle \uparrow | T \downarrow \rangle = 1$$

$$\langle \downarrow | T \uparrow \rangle = -1$$

$$\begin{aligned} T(\alpha|\uparrow\rangle + \beta|\downarrow\rangle) \\ = -\alpha^*|\downarrow\rangle + \beta^*|\uparrow\rangle \end{aligned}$$

Let  $T$  be antiunitary  $\rightarrow T^2$  is  
a unitary operator

$$\begin{aligned} T^2 &= U_T \mathcal{K} U_T \mathcal{K} \\ &= U_T U_T^* \end{aligned}$$

$$T^2 (\alpha |v_i\rangle + \beta |v_j\rangle)$$

$$\lambda T^2 |v_i\rangle + \beta T^2 |v_j\rangle$$

$$\langle T^2 v | T^2 w \rangle = \langle Tw | Tv \rangle = \langle v | w \rangle$$

Also  $T \vec{x} T^{-1} = \vec{x} \rightarrow$  we want

$T$  to commute w/ all spatial symmetries

Schur's lemma  $T^2 = \lambda \text{ Identity}$

$$\lambda = \pm 1$$

$$T^2 = U_T U_T^* = \lambda$$

$$U_T = \lambda U_T^T = \lambda^2 U$$

Spin-statistics theorem:  $\lambda = +1$  for  
integer spin - single  
-valued representations

$\lambda = -1$  for double-valued reps  
(half-integer spin)
