Statics - TAM 211

Lecture 32

December 12, 2018

Chap 10.1, 10.2, 10.4, 10.8

Announcements

- Check ALL of your grades on Blackboard! Report issues
- Prof. H-W office hours
  - Monday 3-5pm (Room C315 ZJUI Building)
  - Wednesday 7-8pm (Residential College Lobby)
- Upcoming deadlines:
  - Friday (12/14)
    - Written Assignment 12
  - Friday (12/14) all in Teaching Building A418-420
    - **9:00 am:** Quiz 6, On paper. Chapter 9 (CoG thru Fluid Pressure)
    - 10:00 am: Discussion section for ALL students
    - No lecture to accommodate quiz 6 testing time
  - Tuesday (12/18)
    - HW 13

Chapter 10: Moments of Inertia

Goals and Objectives

- Understand the term "moment" as used in this chapter
- Determine and know the differences between
  - First/second moment of area
  - Moment of inertia for an area
  - Polar moment of inertia
  - Mass moment of inertia
- Introduce the parallel-axis theorem.
- Be able to compute the moments of inertia of composite areas.

Recap: Area moment of inertia (Second moment of area)

- The moment of inertia of the area A with respect to the x-axis is given by

$$I_x = \int_A y^2\, dA$$

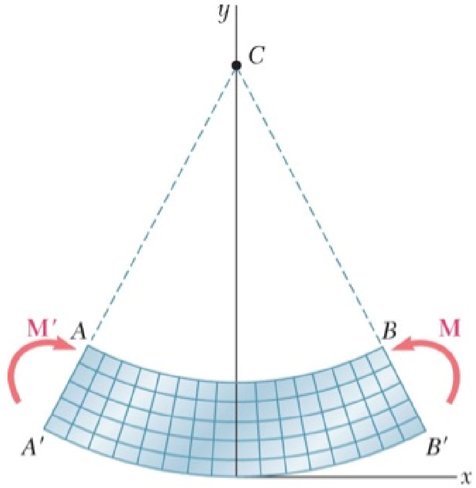
- The moment of inertia of the area A with respect to the y-axis is given by

$$I_y = \int_A x^2\, dA$$

- The moment of inertia of the area A with respect to the origin O is given by (Polar moment of inertia)

$$J_O = \int_A r^2\, dA = \int_A (x^2 + y^2)\, dA = I_y + I_x$$

Moment-curvature relation:

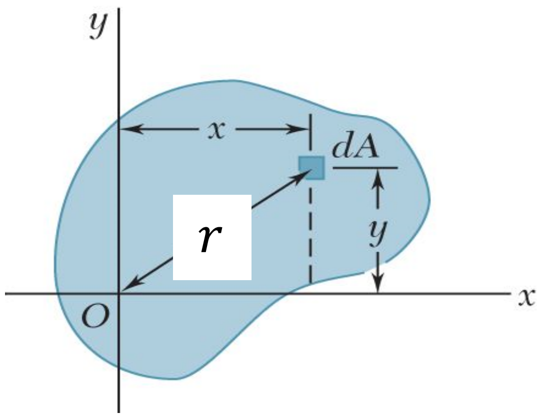


$$|M_z| = \frac{EI_z}{\rho}$$

I_z: Moment of inertia of cross-sectional area

E: Elasticity modulus (characterizes stiffness of the deformable body)

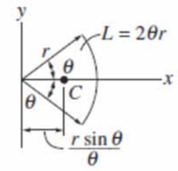
ρ: curvature



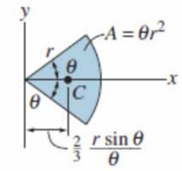
From inside back cover of Hibbler textbook

Geometric Properties of Line and Area Elements

Centroid Location	Centroid Location	Area Moment of Inertia



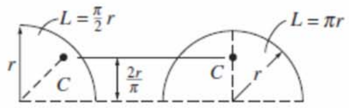
Circular arc segment



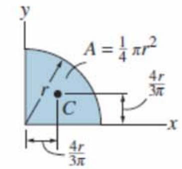
Circular sector area

$I_x = \frac{1}{4} r^4 (\theta - \frac{1}{2} \sin 2\theta)$

$I_y = \frac{1}{4} r^4 (\theta + \frac{1}{2} \sin 2\theta)$



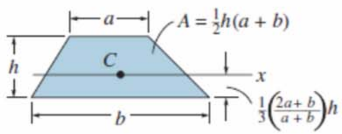
Quarter and semicircle arcs



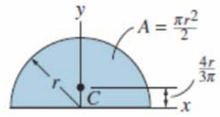
Quarter circle area

$I_x = \frac{1}{16} \pi r^4$

$I_y = \frac{1}{16} \pi r^4$



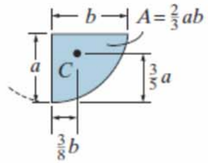
Trapezoidal area



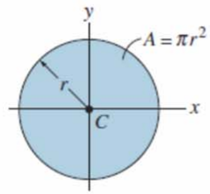
Semicircular area

$I_x = \frac{1}{8} \pi r^4$

$I_y = \frac{1}{8} \pi r^4$



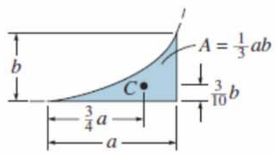
Semiparabolic area



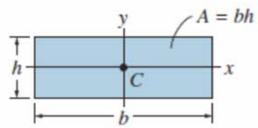
Circular area

$I_x = \frac{1}{4} \pi r^4$

$I_y = \frac{1}{4} \pi r^4$



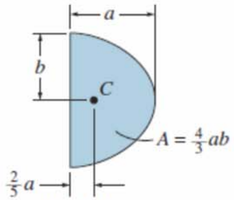
Exparabolic area



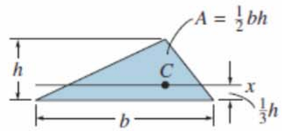
Rectangular area

$I_x = \frac{1}{12} bh^3$

$I_y = \frac{1}{12} hb^3$



Parabolic area



Triangular area

$I_x = \frac{1}{36} bh^3$

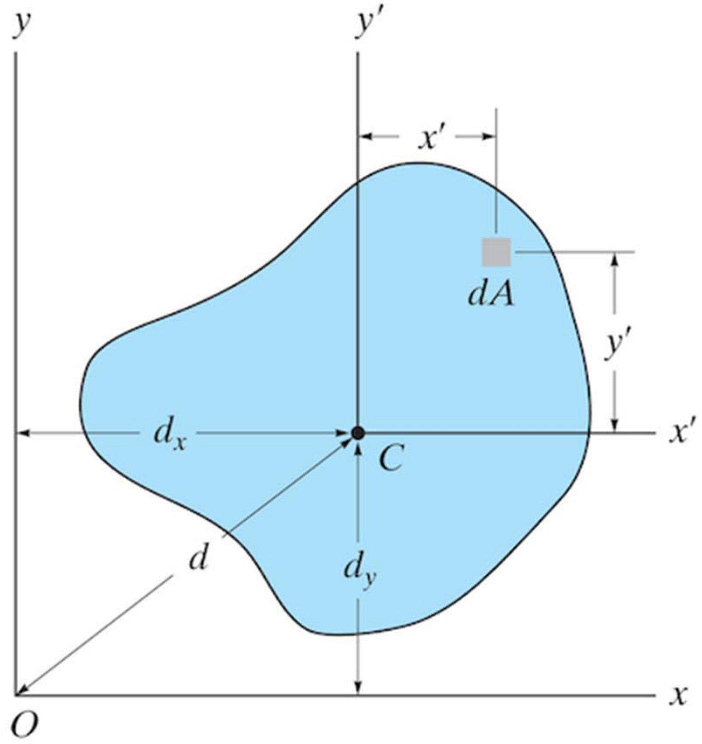
Recap: Parallel axis theorem

- Often, the **moment of inertia** of an area is known for an axis passing through the **centroid**; e.g., x' and y':
- The moments around other axes can be computed from the known $I_{x'}$ and $I_{y'}$:

$$I_x = I_{x'} + Ad_y^2$$

$$I_y = I_{y'} + Ad_x^2$$

$$J_O = J_C + A(d_x^2 + d_y^2) = J_C + Ad^2$$

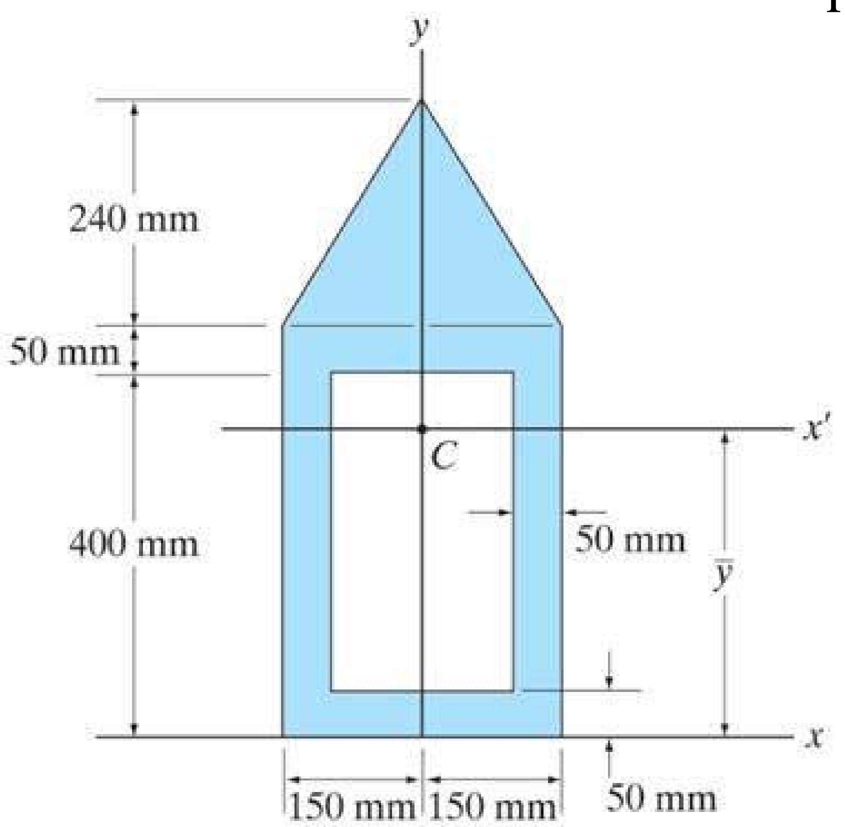


Note: the integral over y' gives zero *when done through the centroid axis*.

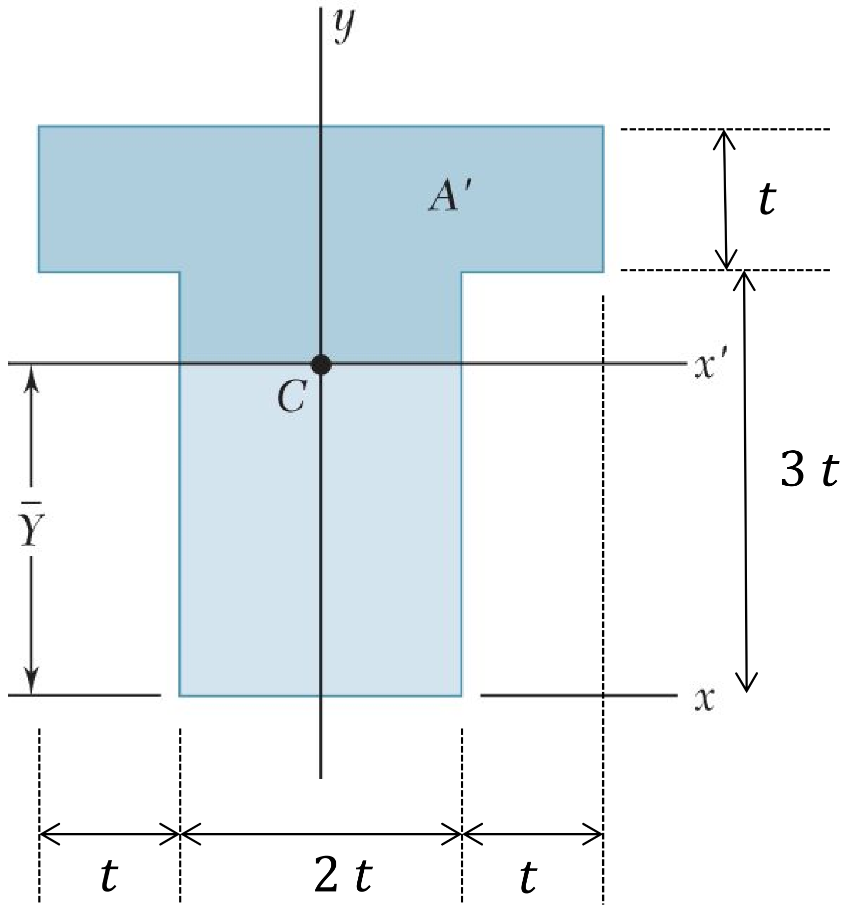
Recap: Moment of inertia of composite

- If individual bodies making up a **composite** body have individual areas *A* and moments of inertia *I* computed through a common axis, then the **composite area** and **moment of inertia** is a sum of the individual component contributions about the axis

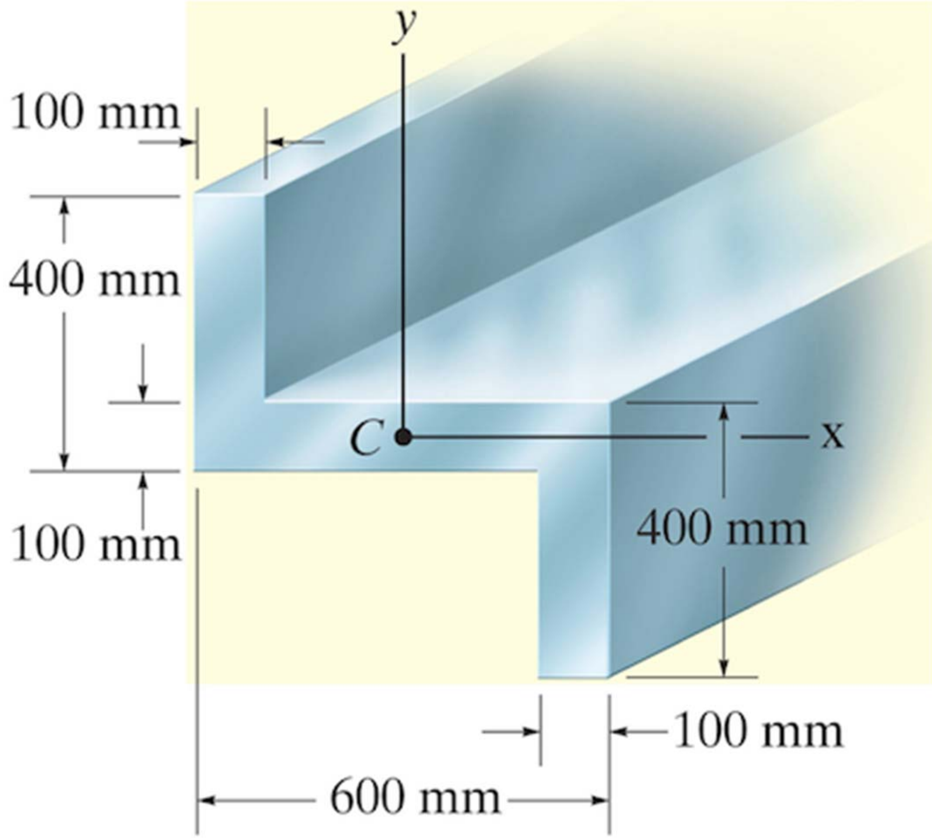
This requires the **parallel axis theorem**:



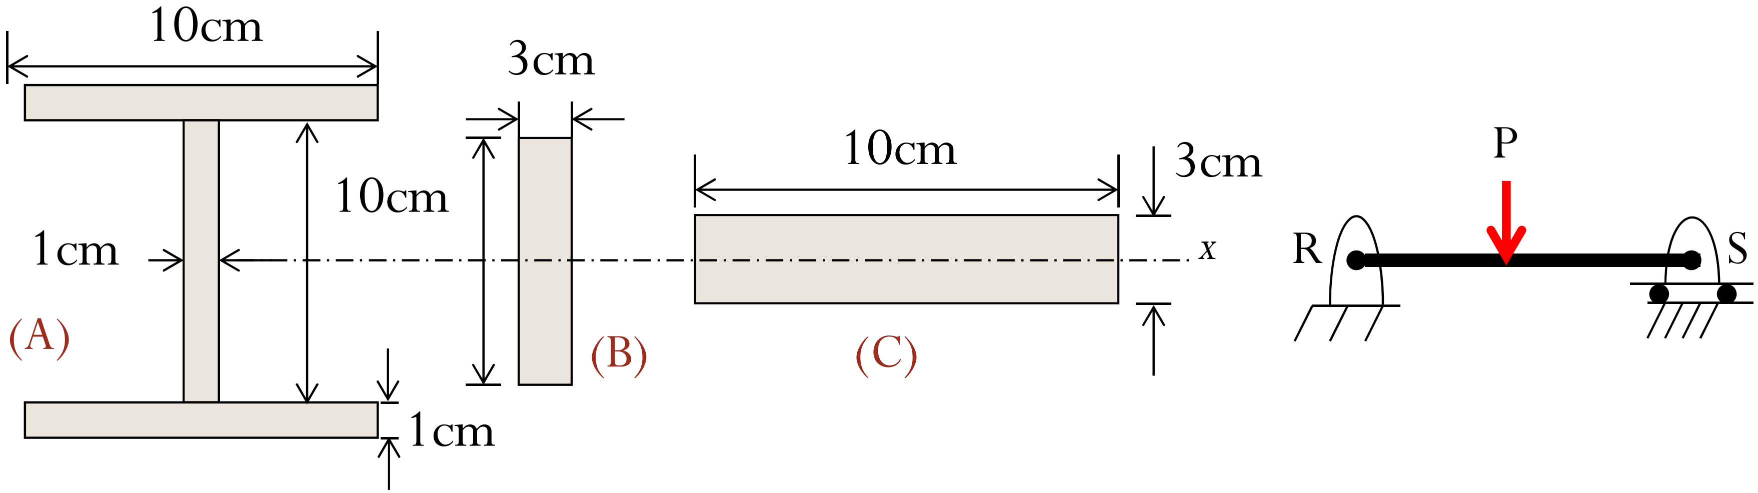
Find the moment of inertia of the shape about its centroid:



Determine the moment of inertia for the cross-sectional area about the *x* and *y* centroidal axes.



Example 10.5 in text



Consider three different possible cross sectional shapes and areas for the beam RS. For the given vertical loading P on the beam, which shape will develop less internal stress and deflection?

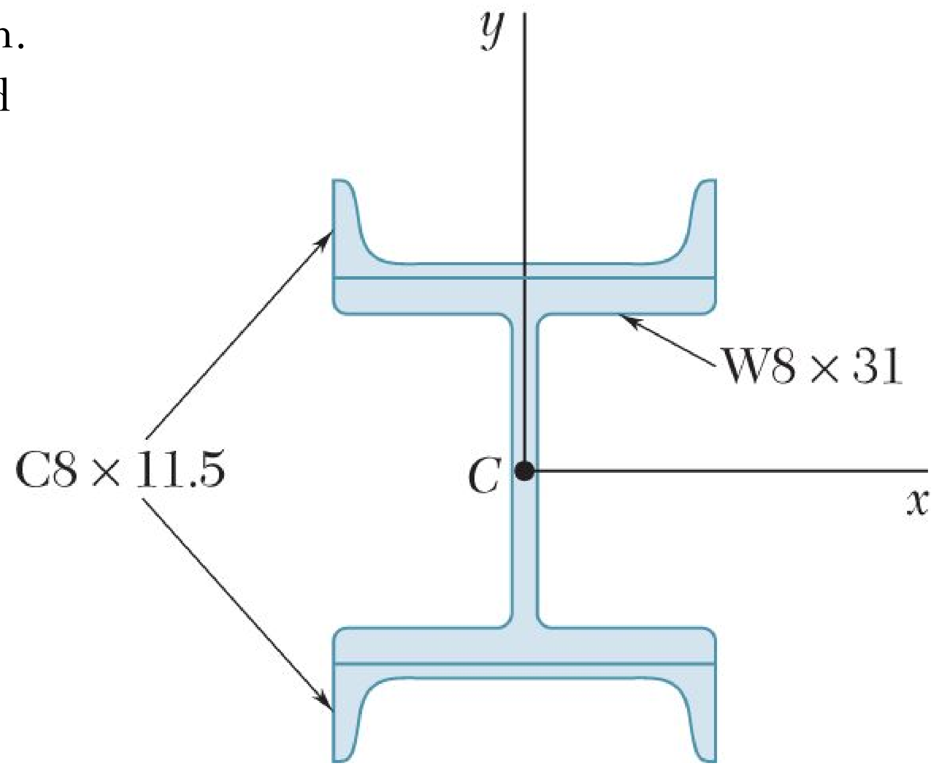
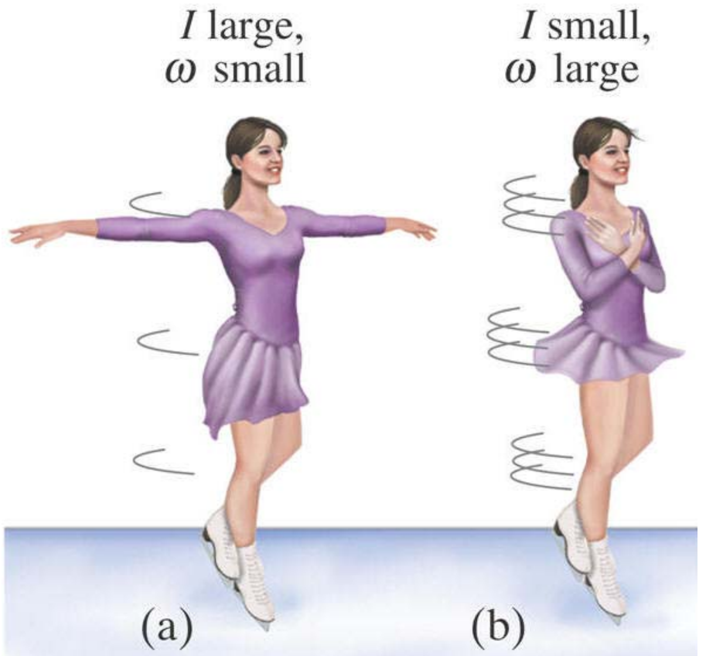
Two channels are welded to a rolled W section as shown. Determine the area moments of inertia of the combined section with respect to the centroidal x and y axes.

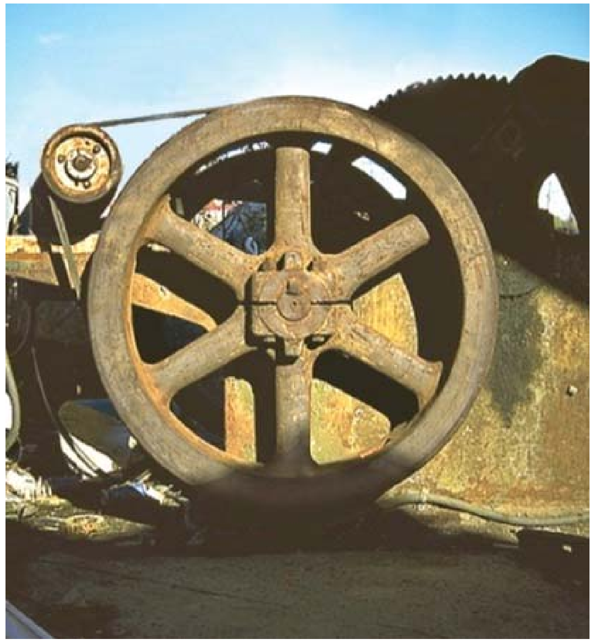


<u>Mass</u> Moment of Inertia

- **Mass moment of inertia** is the mass property of a rigid body that determines the torque *T* needed for a desired angular acceleration (α) about an axis of rotation.
- A larger mass moment of inertia around a given axis requires more torque to increase the rotation, or to stop the rotation, of a body about that axis
- Mass moment of inertia depends on the shape and density of the body and is different around different axes of rotation.

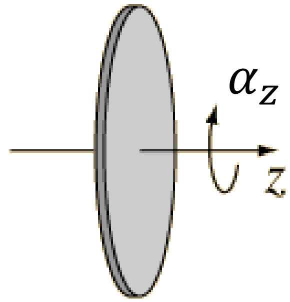


http://ffden-2.phys.uaf.edu/webproj/211_fall_2014/Ariel_Ellison/Ariel_Ellison/Angular.html



Mass Moment of Inertia

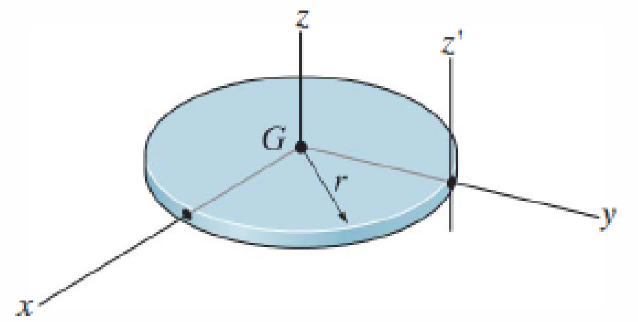
Torque-acceleration relation: $T = I\,\alpha$



where the mass moment of inertia is defined as

$$I_{zz} = \int \rho\, r^2 dV$$

If $\rho =$ constant, $I_{zz} = \int r^2 dm$



Thin Circular disk

$I_{xx} = I_{yy} = \frac{1}{4} mr^2 \quad I_{zz} = \frac{1}{2} mr^2 \quad I_{z'z'} = \frac{3}{2} mr^2$

Mass moment of inertia for a disk:

$$\begin{aligned} I_{zz} &= \int \rho\, r^2\, dv = \int_0^t \int_0^{2\pi} \int_0^R \rho\, r^2\, (r\, dr\, d\theta\, dz) \\ &= \rho \int_0^t \int_0^{2\pi} \frac{r^4}{4} d\theta\, dz \\ &= \rho \int_0^t \frac{r^4}{2} \pi\, dz = \rho \frac{r^4}{2} \pi\, t = \frac{r^2}{2} \rho\, \pi\, r^2\, t = \frac{r^2}{2} \rho\, V = \frac{r^2}{2} M \end{aligned}$$
